## THE ACTION-PACKED COMBAT SIMULATION

"SKYFOX" is the most realistic ever-inspiring combat simulation you've ever seen on your computer. "SKYFOX" special features include —

- ▶ **AIR TO AIR & AIR TO GROUND COMBAT**
- ▶ **3D SCROLLING FLIGHT SIMULATION**
- ▶ **15 SCENARIOS** (from training mission to massive invasion)
- ▶ **5 SKILL LEVELS** (from cadet to ace of the base)
- ▶ **AUTO PILOT FEATURE FOR LAUNCH & ENEMY SEARCHES**
- ▶ **ON BOARD & BASE TACTICAL-COMBAT COMPUTERS**
- ▶ **CONTINUOUS LASER CANNONS**
- ▶ **HEAT-SEEKING & GUIDED MISSILES**
- ▶ **JOYSTICK & KEYBOARD CONTROLS**

**"SKYFOX" NOW · GET "SKYFOX" NOW · GET "SKYFOX"**

Available for the Apple II, II+, IIx, IIfx, & Commodore 64/128 on Disk, and NOW CBM 64 Cassette.

Available from all good software retailers — if it's not there, please order — or in case of difficulty send your check or money order to: **Ariadna P.U.K. Ltd.**, including your name and address to: **44016147 P.U.K. Ltd.**, Suite 105/106, Appleby House, Finsbury Street, London EC2M 6HS.

▶ **SKYFOX** — Commodore Cassette £9.99, Disk £12.99 ▶ **SKYFOX** — Apple Disk £37.95

## Earn your stripes

IF YOU RATE YOUR PROGRAMMING skills highly then you may be interested in doing some professional work for Tigris Marketing.

The company is often approached by publishers and asked to recommend programming to make Tigris designs into commercially viable software.

If you specialise in music, adventure, arcade games, strategy, graphics,

animation or speech then send details to Tigris Marketing and don't forget to say whether you have any professional experience or not.

Contact Julie GATFEL, Tigris Marketing, Suite 12, Hambleton Hall, 80 Upper Richmond Rd, Putney, London SW15 2BQ or phone: 01 871 7136/7.

Is it a bird? Is it a plane...

The 8th  
**Personal  
Computer  
World  
Show**

**4-8 SEPTEMBER 1985  
OLYMPIA, LONDON**

Sponsored by Personal Computer World

THE PERSONAL COMPUTER WORLD Show is the venue for the premiere of Beyond's latest title - Superman. The official launch date is set for October and the game will be available on the C64 on both cassette and disk.

Beyond's managing director, Bill Delaney, is very confident that the game will be a resounding success. He said: "The game has appeal for everyone - easy to understand with plenty of action and interest for the most avid games fan."

## Quiz kids

THE BCS/COMMODORE SCHOOLS Computer Quiz has been won by Weyrick School. The members of the winning team were Greg Michael, Chris Purvis and Tom Duffy. They beat a team from Woodhatch High School and received the first prize of £1800-worth of computer equipment for their school.

The final was hosted by Michael Roob - a long standing TV quizmaster. It took place at the University of Reading and Dr Brian Page, the vice-chancellor, who is also President of the BCS, presented the Momentum Award to Chris Purvis and Derrick Wilson who received the highest scores of the day.

Team members also received individual prizes of a voucher for a free week in Camp Beaumont on a computer course.

Over 400 schools entered and Commodore's Computers in Schools scheme loaned 600 computers to educational establishments for the Quiz. The schools now have the chance to buy the equipment at half price.

## Join the rat race

**HODDER AND STOUGHTON SOFTWARE** has now brought an aspect of horror to your computer screen with a new adaptation of James Herbert's best-selling novel, *The Rats*.

Blood-thirsty rats are roaming the streets of London and you are the person unfortunate enough to have been picked to save the world – again. From your control centre you deploy your forces to combat the menace and then you must venture abroad so you can assess the situation first hand. This section of the game leads you through the streets of London, along the banks of canals and into devilish areas.

According to the makers, the game is a combination of strategy and adventure. The adventure section contains animated graphics.

Available now on the C64 it costs £7.95. Contact: Hodder and Stoughton Software, PO Box 781, Denton Green, Sowerby, Rens 17403 2YD.

## Burnt into memory

A NEW EPROM BURNER SPECIALIST designed for the C64 and 128, has recently been released by Lightwave Systems. Lightwave also supplies 8K and 128K master boards for use with the EPROM burner.

EPROMs modules enable the user to duplicate with 100% fidelity from cassette or disk and are not harmed by magnetic radiation or grease.

It is possible to erase the programs on the EPROM with ultra-violet radiation and it can then be re-programmed several times.

A software registered register makes the EPROM program available to the computer at three different address sectors in 8K sections.

Full instructions and operating and control software are supplied with the product. The EPROM burner costs £24.95. The 128K master board is £24.95 and the 8K board £12.95. For further information contact: Lightwave Systems, 2 Mabley's Rd, Liscard, Wirral, Merseyside L44 1AL.

## Fast mover!

THE QUICKDISC+ FROM IVEHAM Micro is a cartridge based enhancement program for the 544 disk drive.

Iveham claims many virtues for its new product including: fast LOAD and SAVE - less than five times faster - fast FORMAT, fast file copy and fast disk backup on unprotected software.

The utility runs on Ives and is available from Iveham Micro Centre, Bridge St, Iveham, Wiltshire WRT1 4BT.

## Showing off

THERE'S A HUGE VARIETY OF MICRO peripherals on display at the Personal Computer World Show, this year. The show is at London's Olympia and open to the public Friday 4 to Sunday 8 September.

Exhibitors include many big names from the computing world including Amstrad, Atari, Apple and of course Commodore. And there will also be all the latest software on show.

The show occupies two major halls at the exhibition centre and is the biggest so far. All aspects of the computer industry are being covered from home to business, industry to education.

A special attraction is Tomorrow's Micros House which will incorporate all the latest technology in a domestic setting: there's TV, hi-fi, video and computer linked video-disk plus examples of uses for computers in work and leisure.

There's also a special educational section which illustrates the uses of computers in this area.

For those who find themselves spoilt for choice when buying a computer there is a team from the NCC Microsystems Centre and members will be giving help and advice plus demonstrations on buying a computer for business use.

Major software exhibitors include Activision, Microsoft, Mattel and Atlas Games and at the Commodore stand you'll get another chance to have a look at Commodore's new 128.

The show is open from 10am to 7pm except Sunday when it closes at 5pm. Admission is £2 and tickets are available in advance from: PCW Show, 11 Manchester Square, London W1M 1AB.

There will also be an Argus Specialist Publications stand at the Show which will display Argus' wide range of computing publications covering most aspects of the home micro scene.

Come along and see us and have a browse.

## The Ultimate in skullbuggery

Ultimate has a new game for the C64 entitled Blackeye.

The arcade game continues the adventures of Sir Arthur Penchington in an ocean going quest in which he must find

the Crystal Skull of Souls on an island shaped like a skull.

The game will retail at £19.95 and Ultimate's address is The Games, Ashley de la Joux, Letch 128 5BU.

## Eyes down

CRI, A FIRM ALREADY WELL KNOWN for its software, has now moved into the peripherals market with the launch of the Video Digitizer Module for the C64.

The unit allows video signals to be displayed on the screen, stored to disk and printed out.

The Austrian designed Digitizer is compatible with a normal video camera, video surveillance camera, video recorder, video-out on a TV or the output from a weather satellite receiver which is video compatible.

The product displays an image on the screen and the user can pan, with the aid

of the cursor keys, to view the whole picture; initially in four shades of grey, colours can be incorporated using the function keys. Using a lightpen, sections of the picture can be isolated and used later as user defined graphics.

The Digitizer retails at £149.95 and CRI claims it brings sophistication and ease of use, previously out of reach of the home computer owner.

Contact: CRI, CRI Ltd, 3 Kings Yard, Carpenter's Rd, London E15 2HD.

## From bikes to boxing

ACTIONISM HAS PRODUCED A COMPREHENSIVE range of games for the autumn varying from a simulation of the Tour de France to the discovery of a tiny being living inside your PC.

The company has signed up world champion boxer, Barry McGuigan, to endorse its new boxing game. Released at the end of August, Actionism claims that the game "incorporates his fighting style and unique skills right into the gameplay."

The Great American Cross Country Race is a driving simulation which takes you on a coast to coast trip across the USA. Terrain, time of day, weather reports and distance must all be taken into account so there's plenty to think about. You must also watch your fuel and look out for police speed traps.

Somebody's in My Computer is a totally new idea in games. According to Actionism, a little known fact is that there is a tiny person living inside every computer. Actionism now has the technology to enable you to see and make contact with this little friend. You can tell him to do things, take care of him or just watch as he goes about his business. And so too are the rules.

Get on your bike and take part in the Tour de France, the official version of the great French post-bike mania. The

game relies on joystick dexterity to pedal, steer, brake and change gear around the 16 stage circuit. And if you think all sounds too down to earth for you then one of Actionism's other offerings may be your cup of tea. Rescue on Fractalus is a space-pilot simulation which lends you with the difficult task of saving your fellow pilots who have been stranded on the hostile planet, Fractalus.

For utility enthusiasts, Actionism is offering the chance to design your own games the easy way with GameMaster. Designed by Garry Bickels, the makers claim that it can help would-be programmers to create almost any game imaginable.

All the new titles are £9.99 on cassette and £14.99 on disk except Game Master which is £14.99 and £19.99 respectively.

A similar product, recently released, is Computereyes from Stern Computing in Dundee.

Computereyes is a video acquisition for the IBM and enables images to be captured on screen and then dumped to a printer.

It connects the video source to the PC via the User I/O Port and a grey scale picture appears on the screen in about six seconds.

Software is provided which includes machine language image capture routines, a menu-driven executive and image packaging routines.

According to Stern Computing, there are numerous uses for the product: pattern recognition, security, spatial measurement and education.

Computereyes costs £109. A demo disk is available for £19 and a source code disk for £49. Stern Computing can be contacted at 11 Blackness Avenue, Dundee DD2 1BB.

# GAME OF THE MONTH

On creating a hole at the beginning of the game the way is often blocked by a shield which can only be destroyed by the glowing orb hidden in the only shieldless hole in the game. The pathway to the only

This game makes full use of the 3d and it is rumored that there are only a handful of levels left to add in this magnum opus, which will become an essential addition to any gamer's collection.

# 1985 THE YEAR OF COMMUNICATIONS

Set your  
Commodore 64  
FREE

A whole new world awaits you and your 64. The world of Prodat, Micronet, Viewfax, HomeLink, Citicompnet, Compuserve (Commodore's own database) etc. This is the world of product reviews, multi-game games, home banking, business information, connectivity, futures, airchar shopping, real time conversation, electronic notice boards, helpful tips, ICPCUG, news, Telex-Link, Mailbox, Chatline, Gallery etc. This is the world of telesoftware with programmes to download into your 64 and save to disk or tape. Many telesoftware programmes are provided free of charge or at nominal cost.

Dialog with over 680 massive databases on call and almost unlimited information on just about any subject is accessible from your 64, together with 81 Gold, Easylink, One to One etc., with electronic mail, business services and more facilities.

You can link to bulletin boards in your area for local news, club news, brains, jokes, poems, helpful tips, etc. It's a whole new experience.

Take the first step. Make us your link for your 64. Communicate with Modem-House and you'll soon be talking to other 64 users, linking to other micros and swapping files, tips, programmes or just chatting.

Modem-House are the largest suppliers of Commodore communication equipment. We also supply complete systems for the Pet 2000, 3000, 4000 and 8000 series.

The most popular 64 microspack in use today will link you to Prodat, Micronet 800, Viewfax 258, HomeLink, Famalink, Citicompnet, Compuserve etc. From Modem-House, the complete system is on offer at the incredible price of £99.95 inc. VAT, p.i.b.

Optional terminal software to link you to 81 Gold, Easylink, One to One, Dialog and Bulletin boards is available at £29.95 inc. VAT, p.i.b.

Complete Commodore 64 microspack:

special price **£99.95** inc. VAT p.i.b.  
for a limited period only.

**Special, special offer:** order your 64 microspack now and get a **FREE** quarter's subscription to Micronet 800 and Viewfax 258 (Prestel Microcomputing).

# IN·A·R·C·A·D·I·A

I think it's the best, but that's just my opinion. Try it yourself, when it comes out over here!

## Bob's yer uncle

I've been playing *Bounty Bob Strikes Back!* (Big Blue/US Gold) lately, and I have achieved a certain competence: that is to say I breached the elusive 30,000 score, which to my mind constitutes a reasonable score on most games (good rule of thumb, that). My current hi-score is 48,000, and I got to Bob's Playroom as well (level 4, I think).

I like the game for several reasons. It plays well, the music is entertaining and not in the least irritating, and it has the most amazing hi-score table I've ever seen. The sort routine to enable the little birds to pick up the letters and place them in the table is an awesome piece of programming, and that alone deserves you to get to the game. A lot of games claim "arcade quality", but *Bounty Bob* has it. I'd happily push my 18 pence into this one.

## Let's do the time warp again II

I keep mentioning the *Rocky Horror Show*, as I've had the Spectrum (arrghhhh!) Plus the Crystalball version for some time. All my observations on the game had until now been based on the altogether inferior version. I can report with pleasure that the new CD4 version is better: it's more difficult to complete, the music is what a friend of mine would call late (good), and the sound effects are more than appropriate. BUT (and as you can see, that's a big but) the graphics still don't do a bit. I've seen multicoloured sprites that would knock yer over all, but these are chunky to say the least, and more multicoloured forces to say the most. Otherwise a super game and certainly well worth a look.

## Hot tips

**Bounty Bob:** The way the joystick controls Bob can be very precise. To jump onto a close platform push the fire button and just judge the joystick in the desired direction on his way down. Ignore the mutants and only kill them if they're getting in your way. Highest scoring settings: difficulty as medium, bonus at 10,000, and lives four.

**Steavegrip:** Tricks this one. Best advice I can give you is to blast all the stuff in every room before you move on, to make sure it can't multiply again.

**Rock'N'Bolt:** Make good use of the Praetor Module (activated by 10,000

the levels) out before you begin a game.

## Better luck next time dept.

**Fastlander** (Activision) promised to be a really good game. The graphics ain't bad and the sound is fairly good, but it's no *Flipper*! *Flipper*! Who cares whether you make it to the top of the screen or not! Activision should really make the scenario more entertaining, as I really couldn't bear to play this game for more than 10 minutes before I reset and loaded *Bounty Bob* again. Try it out in the shop before you buy it, and see what you think.

**Breakforce** (EPIC/CGO) should be very good, but I couldn't shake the feeling of playing a sort of breakdancing space invader, and paying a lot of spots for the privilege! Technically a very good program, but largely uninteresting and, I suspect, just a piece of hardware hopping. *Epix* doesn't need to do this. It's a good enough company to make much more original games, without this kind of cheap shot.

## Ooops! my mistake dept.

My preface apologies to English software. Last month I featured *Henry's House* in my Transatlantic Preview spot. I was misinformed as they are actually a bunch of Mancunian lads, revealing a map I for some awful fall into; just because a piece of software has superb state-of-the-art graphics doesn't mean that the real piece of software comes from across the Atlantic. There is a great deal of world leading programming talent on this little island (but that we don't know about yet too!) and I promise I won't forget that from now on. (I like 100 lives, *Flippo* - Ed.)

I reiterate my appraisal of last month: *Henry's House* is a very good game. Support your local programmers.

## Mailroom Special Message

Send in your hints, tips, cheats, bugs and hi-scores to Flippo, c/o Year Commodore, Angus Specialist Publications No. 1 Golden Square, London W1R 3AB, and see your name in print.

## This month Bounty Bob

comes out on top and

Rock'N'Bolt rocks into

Arcadia, as Flippo gives you

the low down.

GREETINGS, ACTIONERS! WE BOUNCE back this month with some fabulous tips and tricks for your own arcade games programs, plus a guide to some of the latest offerings to hit the shops, and strategies for some new games.

## Poke in the eye dept.

Here are some interesting POKEs for you to use in your games programs, to obliterate the chances of any unscrupulous person, i.e. me, from cloning your game and stealing it.

POKE	function
775,791	disables LIST
775,787	enables LIST
675,746	disables SAVE
675,745	enables SAVE
675,737	disables LOAD
675,735	enables LOAD
885,119	disables RUN/STOP
885,117	enables RUN/STOP
763,165	disables RSTOR1
763,71	enables RSTOR1
645,x	changes character colour, where every No. from 0 - 7 represents all the lines No. is a Basic program.
11,1	Basic program.
11,1	puts them all back

(This could just as easily put these intrinsic Assembly language programs you could in a Basic one.)

## Transatlantic Preview

**Track and Field** (Konami/Atari) is the best sports game I've played since *Daisy Thompson* first threw a javelin. This is a conversion from the real arcade machine which started the whole sports game trend in the first place. You can play against the computer or a real opponent, with a split screen depicting each player's progress, a lot like *Pitfall*. It

**Listings will be much easier to  
enter with our new system.**

COMMODORE LISTINGS ARE RATHER well known for the horrible little black blobs that always abound. Unfortunately the graphics characters which are used to represent graphic and control characters do not reproduce very well and they are also difficult to find on the Commodore keyboard.

For this reason, four Commodore started to precede any control characters with a list statement (in the parenthesis) that explained exactly what the black blobs were used to be. Unfortunately the graphics characters were not documented and these still cause some confusion. For this reason we are starting to use a new method for marking the control and graphic characters in our listings.

In future all control and graphics commands will be replaced by mnemonic within square brackets. This mnemonic is not typed out as printed in the magazine but rather the corresponding key or keys on the keyboard are used. For example [RIGHT] means press the cursor right key, you do not type in [RIGHT]. All of the keywords, what keys to press and how they are shown on the screen are shown below.

# LISTINGS

Any character that is accessed by pressing shift and letter will be printed as [x LETTER]

[x A]  
[x C]

shift and A  
shift & C

Any character that is accessed by pressing the Commodore key and a letter will be printed as [x LETTER]

[x A]  
[x C]

Commodore & A  
Commodore & C

[x 1]

Any control key will be printed out as a number. For example [001]. Control codes are accessed by pressing the CTRL and a letter at the same time [001] is CTRL & A, [002] is CTRL & B etc. See the manual for more information about control codes.

[001]  
[002]

CTRL & A  
CTRL & B

Mnemonic	Symbol	what to press
[RIGHT]		left/right
[LEFT]		shift left/right
[UP]		Shift & up/down
[DOWN]		up/down
[F1]		f1
[F2]		shift & f1
[F3]		f2
[F4]		shift & f2

Mnemonic	Symbol	what to press
[F5]		f3
[F6]		shift & f3
[F7]		f4

[CYAN]		CTRL & 4
[PURPLE]		CTRL & 5
[GREEN]		CTRL & 6
[BLUE]		CTRL & 7
[YELLOW]		CTRL & 8

# Teacher's

## Pet

Margaret Webb continues her look at maths with this round up of programs.

### Maths Part Two

LAST MONTH I LOOKED AT HOW THE CBI along with some software, can help the ground school child get to grips with basic number learning.

Once this, the most important hurdle, is over and the child is at school, the computer must take a secondary role in his education. This is not because there is no suitable software available - quite the contrary - but because the child should be doing such tasks at school in front of us, work being thrust upon him at home. However, if your child is slipping behind with his work or if he shows a real enthusiasm and wants to do extra, there are numerous programs to look at.

Let's not get looking at some programs which re-egg the four basics of arithmetic - addition, subtraction, multiplication and division. There are numerous programs which deal with this aspect of number work, it is also the easiest to get wrong. Some programs are straightforward teach and test and can be very dry and boring. There can do more harm than good. Others use the capabilities of the 64 to create eye-catching graphics which grab the child's attention and hold it so the child is learning without really being aware of it. At age six, more learning is done in an atmosphere of fun than by having it force fed. Several Publishers have recognised this and in consequence have produced some fun to play games, which also teach and/or test.

Maths Software For a lovely program in the fun to learn series, Microsoft Maths is a collection of programs which cover size estimation, mental arithmetic, multiplication tables and logic. Forbarns has a different format but is written to give maximum fun while still helping the user to learn. In one game the player feeds in a lion's name and then tries to answer three questions correctly in a specified time. If the player is successful his lion is eaten by a monster, if not he himself is eaten.

Another part of the tape covers multiplication tables - one of the boggiest of education. I believe they are an essential part of mathematical training. Would your child's school be one where they are not taught these or some packages are the way to help.

Collins produces Prime Your Tables. This is a cassette and Tandy set which works straight through tables up to 18. The booklet has lots of related exercises

and shows the user the patterns formed by the numbers.

McGraw-Hill has just released a collection called Ladders to Learning. Included in this series are computers dealing with addition, subtraction and problem solving. There are also titles dealing with multiplication and division. The child is led through the maze of learning tables by a cartoon character, Henry Hilo, and his friend a number machine. Once multiplication is mastered division can be tackled and then more Henry shows that if the child can do subtraction and multiplication he can divide.

My overall favourite for learning and using basic number rules is Number Ladders by Fisher-Price. This is a cartridge based game in which you have to arrange a figure around a goal using the numbers and operation to make a series of totals. The game can be played by children and adults alike as the parameters can be set to a very simple or extremely difficult level. The game can be fun and furious and calls for quick thinking especially when playing against the computer.

There have four rules cover many other aspects: telling the time, using money, fractions, decimals and graph work. Collins and Good Housekeeping both have packages dealing with telling the time. Mr F Tells the Time uses the computer graphics to create pictures to teach the position of the numbers on the clock face and the rudiments of telling the time. Collins' What's the Time was a cassette and booklet approach to learning

about the quarter hours, half hours and hours. It uses both analogue and digital clocks in its examples.

For a completely different approach look at A.S.S.'s Time Trucker. This consists of three games in which the player guides a truck around a map collecting fruit and vegetables and taking it to market. In the first game, every time the driver stops to collect produce he has to check in; however the clock on the screen is an analogue clock and the time has to be entered in a digital form. All good fun and very educational.

Fractions, decimals and graph work are all covered by the Ladders to Learning series. There is also a cassette which explains algebra. They follow the same format as the previously mentioned Ladders to Learning series. Henry Hilo explains simply and logically each subject making full use of the graphics capabilities of the machine. Test questions are set to see if the child is understanding everything.

This set of programs should not be used as matter of routine at home. If your child is having problems at school or wants to do extra work, use the class teacher involved before deciding to purchase anything and then try to have a good look at the programs available in your local shops. Whatever you do, don't force your child. You may put them off mathematics and thus defeat the object of the exercise. Numbers can be magic and your Commodore can help you show your child the fun.

### Other Programs to Look Out For

Sprites/Numbers by Commodore - addition and multiplication games.

Number Poster by Commodore - five games dealing with the four rules.

Mathematics by Longman - 'B' level revision package.

Numbers at Work by Collins Business - maths education for adults. Covers fractions, decimals, square roots and V.A.T. and P.A.T.I. problems.

# STEP INTO THE FUTURE WITH "C POWER" —

the C Language Compiler for the COMMODORE 64

**ATTENTION ALL  
COMMODORE 64  
PROGRAMMERS**

Your personal guide to "C".  
The world's most effective and  
convenient programming language.

C POWER is a fully  
implemented, standard C  
Language compiler for the  
COMMODORE 64—true PRO-  
FLEX SOFTWARE.

This powerful package comes  
complete with:

- A three-and-a-half disk set
- A 331 page C Language  
Tutorial, "C Power Plus"—"a  
friendly, easy-to-use guide to  
learning and using C"—
- A 64 page user's guide  
complete with listing and  
explanation

## C POWER GIVES YOU MORE:

- Standard editor, Syntax  
checking editor
- Shell Environment Manager
- Linker and Translator
- Standard System and Math  
function libraries
- Lots of Utility Routines
- Sample programs
- Inexpensive, four-way scrolling  
and cut-and-paste facilities
- Value for money at \$119.95

## C POWER IS:

- **Keypal Free**—anything you  
write on C Power belongs to  
you
- **On-Line**—the C Power bulletin  
board system operates 7 days a  
week, 24 hours a day—to  
update your function libraries  
and answer your questions
- A fully functioning,  
nonproprietary, compatible C  
Language Compiler for the  
COMMODORE 64.

## THE EXPERTS AGREE:

"an excellent package...  
deserving to bear anyone's  
software library"

*John Clegg, INFUS, p. 12,  
July 1985*

"a refreshing change... with the  
speed of machine language and  
the universality of BASIC"

*Mark Roth, INFUS, p. 14,  
July 1985*

### ORDER FORM

For your C POWER PACKAGE, send this form to:

**Pitman Publishing Ltd**  
138 Long Acree  
London  
WC1E 9BA

Please send me C POWER, price £119.95 (inc.VAT)  
RSH-0275 02482 5

I enclose a cheque/postal order (Payable to Pitman  
Publishing Ltd)

Alternatively, please debit my

779. This routine is called by Evaluate expression and transfers control to one of the four arithmetic routines included in this package. If the Extended Basic command is not one of the four arithmetic routines, 'syntax error' is output.

## Function keys

This routine is wedged into the keyboard table set-up vector at locations \$036F-\$0376 (\$35-\$36). The routine checks if the computer is in direct or program mode. If in direct, the normal routine is executed. If in program mode, the quote flag is checked and if set, the normal routine is executed.

The current key pressed is checked for one of the four function keys and the shift key. If it is a function key, the test for that key is passed from behind the Basic ROM and put into the keyboard buffer until all eight characters or a zero level terminator is found. If not a function key, the normal routine is executed.

## Program User

This routine is wedged into the input vector at locations \$037A-\$0385 (\$36-\$37). It exactly simulates the normal input routine. First the input device is checked for keyboard. If not found, the normal routine is executed. Direct mode is then checked for and if not found, the normal routine is again executed.

The next part of the routine is created directly from the normal routine except that the cursor down key is checked for and, if found, then the cursor position is checked. If the cursor is not on the bottom line of the screen, the cursor down character is printed. If the cursor is on the bottom line, instead of printing cursor down, the next line number is found and that line listed (any output device).

NOTE: there is no check for quote as if you're entering a line on the bottom line of the screen, the line will be wiped out and a line listed if you press the cursor down key even from within quotes.

When the last line of the program is listed, the cursor will remain at the end of the line, cursor down again will produce the message:

\*\*\*\*\*END OF PROGRAM\*\*\*\*\*

after this, the program will start listing from the beginning again.

## Print

The purpose of this routine is to PRINT characters to the open CMB output channel (usually what three - users). This version of PRINT does exactly the

same as the Basic PRINT except that a check has been made for the CTL command to be included. The syntax for this modified command is exactly the same as that of the Basic PRINT command.

## The First Extended Basic Command

## Clt

Abbreviated entry: Ctl[HT]

Abbreviated Basic abbreviation: none

Tokens: Hex \$1150 (Decimal 1381)

Modes: Direct, program, and in PRINT statements

Purpose: To replace cursor and colour characters, screen and border pixels, thus improving the ability to position the cursor anywhere on the screen. If the value is not specified, the current value is used.

Syntax: Clt [R][C][X][Y][B][L] [I] [J] [K]

[[I]]

Where x is the column position of the cursor (0-24), y is the row position of the cursor (0-24), c is the cursor colour, b is the screen colour, l is the border colour (0-15), and k is a flag for clearing the screen (0 = no, 1 = yes).

Notes: Syntax error - if the syntax is not as above.

Illegal quantity - if the values are out of range.

Use: Clt is a powerful screen handling routine. Cursor, screen, and border colours can be set with a number (0-15), and the cursor can be positioned anywhere on the screen by entering the x position (0-24). There is also a screen clear flag (k), if set to '1', will clear the screen before positioning the cursor. To make it easier to describe, here are a few examples and what they do.

Clt [0] positions cursor at middle of current line

Clt [80] moves cursor to 80 (home position)

Clt [ ] sets cursor colour to white

Clt [ ] sets screen colour to black

Clt [ ] sets border colour to black

Clt [ ] clears screen leaving cursor at current position

Clt [23][23][15] clears screen (15), sets screen to black (0), border to medium grey (11), cursor colour to green (5), and cursor position to column 23, row 15. To print something at a specified location on the screen:

PRINT Clt [x][y] "ctl[x][y] "more text".....

Routine entry point: \$884B

Routine operation: The current settings of the five parameters are read and the screen clear flag is set to 0. The open bracket character is scanned past and each of the six values is read if present, checking to see if there is a closing bracket. When the closing bracket is found, the screen is cleared if the flag is set to 1, and the other values are stored in their own locations.

Machine Code Listing

## Machine Code Listing

[illegible][illegible]

**Dave Cripp has been looking at serious business software from Gemini — here's his verdict.**

THIS LITTLE OFFERING COMES FROM Gemini, a company purporting to be the home of "serious software". The title suggests that Gemini has more business goodies in the pipeline and the "serious software" slogan bears some thinking about. Looking up "serious" in my dictionary gives the synonyms such as "grave" — perhaps a portent of the consequences of running the software! Anyway, here's the first...

**Business Pack No 1** contains a Cashbook system, a VAT file facility and a Final Accounts package. A pretty comprehensive trio of programs for anyone who needs to keep accounts.

The pack comes complete with three manuals/user guides. These are quite well presented if a little light on content and obviously devised by someone who knows accountancy and computers a great deal better than I do the users.

My accountant was quite impressed with the facilities offered by the package, but threw up his hands in horror when I explained that it was designed for use by small businesses with little or no computer in either book-keeping or data processing.

The review copy came on disk and loaded painlessly enough, albeit slowly. The tape-based version comes on three separate cassettes and, presumably takes long enough to LOAD to allow you to pop down to the Dog & Diskette for pint.

Finding a spelling mistake in the opening paragraph of the operating instruction notes does nothing to improve sagging confidence, but plough on regardless...

Each session begins by requesting you to enter a date. Remember its accuracy is vital to the end result. The system calculates the day of the week for you — but take care!

Various prompts appear to assist you as the session progresses. Obviously when setting the system up from scratch there are functions to carry out which won't be required again until the start of a new accounting year. The first of these (and potentially the most dangerous) is prompted by "Initiate a new file!". A "Y" response requests confirmation. At this stage if you respond in the affirmative all account balances are cleared down — not much fun if you are halfway through your financial year!

Cashbook entries are restricted to 25 transactions per batch, whilst analyses and posting totals are only allowed to five

BUSINESS

# BUSINESS FILE

separate accounts. If you are inputting a lot of data it is wise to do some pre-processing analysis of your own (i.e. sort different types of transactions into separate piles). Gemini recommends labelling each batch with a header containing details of the entries — imperative if you are to have any check against the various totals which will eventually appear on your printed reports.

Each of the three systems gives you a menu. The options obviously vary according to the particular service you wish to access. Every conceivable alternative is included, but be sure you fully understand the implications of the actions you take — particularly at the journal entry stage. Single entry journals are favoured by many accountants. To make sure you're happy to use to keep plenty of documentary back-up and remember that there is no automatic entry to Control or VAT memo accounts. Always err on the side of caution.

There are enough report options available to satisfy the most critical of accountants and the output from the VAT File system should be sufficient to allow you to complete your returns without any problems.

The usual dangers stalk the night for as printers are concerned — a general problem. Don't switch off in the wrong sequence or while a program is running. Also, if you use anything except a Commodore printer (who doesn't!) you will need to change the ASCII code for E. The relevant code should appear in your printer handbook.

I would strongly recommend that you purchase one of the "Accounting Made Easy" type books and have a good read before using this package.

Until you have some grasp of the principles of double entry book-keeping you will have untold problems. Gemini advises that you approach your accountant prior to preparing profits & loss account and balance sheet — sounds like a good idea.

Two particular aspects of the package are especially poor.

Firstly, paragraph using the section of the manual referring to data saving (I didn't have the nerve to test it) "If an error occurs while you are saving data, type GOTO 344 and try again" — how polished and professional can you get! When I was a green young programmer if I'd suggested to my project leader that such a statement should appear in the operator's instructions, I would have been flayed alive with a wire brush.

Secondly if you accidentally hit RUN/STOP and RESTORE simultaneously you automatically lose any data input during the session.

I find it difficult to recommend Combination Business Pack No 1 as there are a number of better and cheaper alternatives. Gemini still has three important lessons to learn: Do more market research when the "bells" ring; work — convert them to a faster medium such as machine code; employ good systems analysts and a technical author.

Bill on No 2.

The best part of this particular issue is the lovely lady who appears, smiling, on the front cover. If only someone could plug her C&A into the TV monitor for her.

# COMMUNICATION

One of the biggest problems with Compunet is actually finding your way round the system. To help you, here is a list of major areas that are available. If you don't already own a Commodore modem just look at what you're missing.

# COMPETITION COMPETITION

Fancy the chance of winning  
a prize worth £1000?

Enter our competition and  
you could win one of 30  
copies of our Game of the  
Month.

## The rules

ENTRIES WILL NOT BE ACCEPTED FROM employees of Angus Specialist Publications, Wizard Development Company Ltd and Allsource Pastimes and Toys. This restriction also applies to employer's families and agents of the companies.

The how to enter section forms part of the rules. The Editor's decision is final and no correspondence will be entered into.

## How to enter

There are a few differences between the two pictures. Study them carefully and circle the differences on the picture attached to the coupon. Fill in the coupon clearly and seal the picture and coupon in an envelope. Write clearly the number of differences you found on the back of the envelope.

Post your entry to:  
William Competition, Your Commodore,  
No 1 Golden Square, London W1R 3AB.  
The closing date is first post on Thursday, 31st October 1985. You may enter as many times as you like but each entry must be on an official coupon - not a copy - and sealed in a separate envelope.

Important: Please follow closely the guidelines on entering - incomplete coupons and entries with no numbers on the back cannot be considered. If you are a winner, the coupon will act as a label for your prize so clear writing is essential.

Name: .....  
Address: .....  
.....  
.....  
..... Post code: .....

Number of differences found: .....  
Send to: William Competition, Your Commodore, No 1 Golden Square,  
London W1R 3AB. Write clearly and fully and don't forget to put the number  
of differences you found on the back of the envelope.

## COLLINS - THE BEST IN COMPUTING BOOKS

### Mike Hampshire Commodore 64 ROMs Revealed

Armed with this book any serious programmer of the Commodore 64 will be able to make the fullest use of the machine's potential as well as providing a fascinating insight into the way it works. There is a full annotated assembly listing of the 64 ROM software and each routine is shown in detail.

0 08 86087 X £8.95

#### Order Form

Please order from your local bookseller or send this form to:  
Dept. 25, Collins Publishers, 8 Colston Street, London W1X 3JA

Please send me copies of **Commodore 64 ROMs Revealed**  
0 08 86087 X £8.95

I enclose my remittance for £

(please add £1.50 for first purchase plus 50p for each additional item)

Forth. It may solve your

problems.

FORTH IS A REMARKABLE LANGUAGE. Not only is it the fastest language available for home micros, but it is also very easy to implement, just about everything is unique to this language, and many people have used it for various applications.

To get an idea of Forth it is worth looking at its history. Forth was developed in the late 60s by one man called Charles H Moore. Moore was working at the National Radio Astronomy in Kitt Peak Arizona, and was very frustrated with the limitations of existing programming languages.

Over the years, Moore developed a set of programming tools which he could add to when he pleased. He decided to develop his tools into a control language, and Forth was born. Since then, there have been numerous versions of the language, but basically the choice is between two Forth-77 and Fig-Forth.

The first point to note about Forth is that it doesn't use instructions or commands like Basic. Neither is it restricted to the number of facilities a programmer when purchased. Instead, Forth uses words. Every version comes with a set of words that make up the nucleus of the language.

The set of Forth words is stored in what is called the dictionary. Just like Basic (but more flexible) a Forth program can consist of any number or combination of words. VUST is a Forth word. Its purpose is to display the contents of the dictionary. About the only other similarity between Basic and Forth is that the latter has an immediate mode where single-commands (any, words) can be executed. For larger programs, an editor of some sort is used to enter the source code.

The real reason why Forth stands head and shoulders above the rest is its facility to allow the user to add to it. The analogy of someone opening a door will demonstrate this point as well as show the structure of a Forth program:

```
( GRASP GRASP HANDLE ;
  TURN TURN HANDLE ;
  OPEN PULL DOOR TOWARDS YOU ;
  ENTER MARK THROUGH ;

  DOOR GRASP TURN OPEN ENTER ;
```

# GOING FORTH

In this example, there are four words, grasp, turn, open and enter. Each new word consists of a number of Forth words which are terminated by the semi-colon. Finally, a word called DOOR has been defined which consists of the other four words. So, to perform the four words I would simply enter DOOR.

## The Stack

Forth has been described by many as the high-level low-level language. The reason for this is because Forth allows such high-level control structures, yet requires the user to maintain the stack. As a matter of fact, the stack (and understanding how to manipulate it) is probably the single most important aspect of learning the language.

The reason for this is because practically every Forth word alters the contents of the stack in some way. So it is entirely up to the user to maintain the stack, as there is no error-checking/forced checking or such like. Even though it is a difficult concept to handle at first, stack manipulation does have its rewards. In Forth's case it produces programs that can run at 80% of the speed of machine code programs.

The stack itself is an area of memory that is used as a temporary storage space for numbers, data, and such like. It operates on a first-in last-out basis, and numbers can be added to it (pushed) or removed (popped).

To put the number six on the stack in Forth in immediate mode, the following is done:

```
6 RETURN
```

This places six on the stack. Adding more words is simple:

```
5 2 9 3 4 21 RETURN
```

Removing the numbers from the stack can be done in a number of ways. By far the simplest is to print them, and this is done with the dot command '.', which removes one item from the stack and displays it:

```
—— RETURN
```

would print:

```
21
34
9
2
5
6
```

The reason for the 'backwardness' is because the first number placed on the stack will be at the bottom, and hence the last out.

The two methods of placing numbers on the stack are in the immediate mode (as above), or within a colon definition (a program). Here, a word called ADD has

been defined which adds two and seven and prints the result:

```
: ADD 2 7 + .
```

By simply entering ADD, the number nine will be displayed. This is not a very good way to add two numbers, so like Basic, Forth can get the two numbers at run-time:

```
: ADD + .
```

To add two numbers the following is entered:

```
2 5 ADD  
7 OK
```

Notice the 'ok' which is the equivalent of Basic's Ready prompt.

## Reverse Polish Notation

Forth requires that numbers to be operated upon should be on the stack prior to the operator. In other words, to perform a mathematical function, it is necessary to place the operand(s) before the operator(s), and not mix them as we humans do:

3 + 7 is the equivalent of 3 + 7

We humans perform our calculations in infix notation, but Forth does it in postfix notation, known as reverse polish notation. Here are some algebraic expressions in infix notation (normal) with their postfix (Forth) equivalents:

Normal	Forth
A+B-C	A B + C -
(A/B)*C	A B / C *
A*B-C/D	A B * C D / -

It looks confusing at first, but it is surprising how easy it is to adapt.

The reason why postfix notation is used is because computers find it easier. As a result, this also contributes to Forth's speed.

## Definitions

In Basic programs words are written, but in Forth words are defined. To inform the micro that you are defining a Forth word, two Forth words ':' and ';' are used together with a name for that word:

```
: name forth-words;
```

Once the definition is entered, it is placed within the dictionary and can be used just like any other Forth word. Other Forth words could use other definitions.

One of the great advantages that Forth has over conventional procedure-languages is that it is possible with many versions of Forth to inform the package that you wish to make your words part of the language

itself. Thus, the next time you load Forth your own defined words will be part of the language!

Finally, the following Basic/Forth speed comparison demonstrates the speed of Forth. The two programs are identical in operation, and perform the following:

```
Clear the text screen  
Fill the colour map with the value 1, i.e. white.  
POINT to the screen display 26 complete screenfuls.
```

The result is that a screenful of A's will be displayed, then B's and so on, to BASIC the test took 115 seconds to complete, and in (MetaSource) Forth it took 10.23 seconds!

```
10 PRINT "CLS"  
20 FOR C=52296 TO 52296  
30 POINT C,  
40 NEXT C  
50 FOR I=1 TO 26  
60 FOR P=52296 TO 2000  
70 POINT I,  
80 NEXT I  
90 NEXT I
```

```
: test CLS  
52296 52296 DO  
1 1 C  
LOOP  
27 P DO  
2600 2000 DO  
1 1 C  
LOOP  
LOOP;
```

## Reviews

It is very easy to implement Forth as a micro-especially one like the 64. As a result, there are at least seven implementations of the language available in the UK.

As you can see from the list, the prices of Forth packages differ. The features offered also vary, and it is a good idea to think about why you need the package. If, for example, you wish to expand an existing Forth, with a no-frills package, then fig-Forth could be what you are looking for. On the other hand, White Lightning from Osis Software offers many extensions. Another very good version is Forth+ from Melbourne House. With this package it is possible to produce your own stand-alone programs with ease.

Reviewed here are just four of the packages currently available.

**Fig-Forth**  
**Romik Software**  
**Tapc only — £14.95**

Although this version is one of the cheapest, and offers no 'extra's' at all, it is a great package!

This is because of the way in which the package has been implemented. Romik Forth offers the user a true fig-Forth environment without any additions of any kind. This has its advantages. First, it saves memory time that would otherwise be used for extensions that the user may not want in the first place. And secondly, the

user can expand and customise the package without having to worry about workarounds that may be used by extensions.

This said, I wouldn't recommend Romik Forth for the absolute beginner. Forth is unfriendly by nature, and Romik's version, an exact implementation, reflects this!

In use, the Romik Forth proved very fast, more compared with other Forths. The only slow aspect was the screen output. I believe the authors have made a CALL to the Basic/terminal I/O ports and used the same routines as Basic for screen output. This is a pity, as it is possible to optimise this routine, thus speeding it up.

Being an accurate implementation of Fig-Forth, Romik Forth uses the same editor as most Forths - and a horrible editor it is too!

When Forth was designed, no method was specified for inputting source code. A US member of the Forth Interest Group (hence ifig) designed a crude but practical line editor, published in the user groups newsletter. The author suggested it should be used until someone designed a better one. Unfortunately, everyone (including the software houses) decided to use it, and it's still being copied in Forth implementations today!

#### **Forth-64 Audiogenic Cartridge only—£29.95**

The standard editor used in Fig-Forth is not the only 'old-punter' about the language. SAVING and LOADING to and from a backup device is also complicated.

However, in this case, there is a justified reason. Forth was designed to use dynamic storage meaning that memory is treated as the backup device. The idea behind this is to speed-up SAVING and LOADING. Only when you physically wish to store or LOAD the data (at the start or end of an editing session perhaps) would you **FLUSH** the data to disk or tape. In other words, dynamic store is a go-between the memory and tape/disk.

But managing the Random is a tricky business in standard Forth. Audiogenic Forth-64 gets round this problem by offering easy-to-use Forth words for saving and loading program screens. Not only that, but the RDR bus is fully supported, so it is possible to control (with some care) any device hooked on the back of the bit.

Audiogenic's Forth is supplied on cartridge thus SAVING the user the drudgery of LOADING from tape to disk. Not only that, but being on cartridge frees memory for more source screens which is quite important.

Numerous words cover tape/disk I/O and the RDR bus, but there are no graphic or sound extensions on the 64 version. But it should be noted that the Vis-20 version

does have a word for changing the border and screen colour as well as loading the sound registers.

The editor used in this version is based around the original, but makes good use of the Commodore function/arrow keys. What is a bit unusual is that the screen used for direct mode is a Forth editing screen. This means that when the end of the screen is reached, it is necessary to clear it before continuing. This is quite awkward, and takes away some of the immediacy of direct execution.

However, screen (as in editing) management is very well organised with a lot of the mundane tasks being done automatically. A screen is selected, and after the program source has been edited, it can be loaded into main memory and run. To actually save or load a number of source screens, a file is specified in the **SAVE/LOAD** command, and Forth will save or load the required number of blocks - simple!

#### **White Lightning Omni Software Tape—£19.95, disk—£29.95**

White Lightning is quite simply the best value for money you can get. For the price, you not only get a good implementation of Fig-Forth, but you also get a graphics development system.

White Lightning is a fairly complex package that can be used to develop commercial programs. The package is Forth based and includes a Fig-Forth nucleus. Built around this is a graphics development shell called **EDGA**, which contains numerous sprite and sound words which are used in the Forth program. As well as this, it is possible to access Basic within a White Lightning or machine code. Once the program has been developed and debugged, it is possible to save it in a stand alone version that can be freely distributed.

Both disk and tape versions are available, but the 'hacker' programmer should opt for the disk version as it is necessary to save and load sprite data as well as the Forth source if a graphics program is being developed.

As mentioned it is possible to include Basic statements within the Forth source. This will mean that the program will not run as fast as it would in Forth only, but it is a great help when starting off with the language.

#### **FORTH-80 Melbourne House Tape—£14.95**

Although only recently released, Forth-80 has a long and interesting history. This Fig-Forth based package was initially developed for the ZX Spectrum by Abbotson.

Forth-80 is supplied on cassette which is recorded in the Fastload format and takes under three minutes to load. Disk users will be relieved to hear that the package can be transferred to disk with just two simple commands. Once saved to disk, the package takes 40 seconds to load and uses the disk as the main backing device.

Supplied with the cassette is a (groovy) 36 page manual which covers the bare essentials of the package. There are a number of features within the package that are not documented in the manual, but I understand that Melbourne House will be releasing a full length manual in the near future.

Forth-80 is based around Fig-Forth and offers a number of interesting extensions. First, the screen editor has been adapted to make use of the C64's editor. Source code can be entered into any of the nine screens in a free format, and an edit session can be aborted if desired. One point missing from the editor is the ability to delete carriage returns. This may not sound important, but when editing in a free format (such as the example program) this becomes essential.

Another interesting feature is the ability to produce stand-alone programs with the package. After your masterpiece is created, **DAP** followed by the name of the word will save a machine-code file which can be loaded from Basic. However, the code that is saved is as large as the Forth itself (36 blocks), and probably contains most of the package. There are more elegant methods of achieving the same thing.

Screens modes included within the package are:

- MC64 Multi-colour mode
- MC64 Normal colour mode
- ICBM Extended background colour mode
- HBGM Normal background colour mode
- HBGM High-res mode
- LRG Low-res mode

All the normal colour functions such as border, ink and background are supported, together with pen and draw. Screen sprite commands are included as well as 16 sound commands.

In use, Forth-80 proved to be excellent. Even a semi-fatal crash could be recovered from re-8'ing back into the main code. The package is not overreliant with features, but the facilities which it does have are perfectly adequate.

#### **Other Forth Packages**

There are numerous versions of FORTH available, and here is a list of some:

- Forth 64     Handle Software     £38.95
- Forth 64     Hware     £34.95
- Fig-Forth     Adamant     £73.95, £74.95

**Nick Hampshire brings you a  
detailed look at the C-16  
Operating System variables  
and memory map.**

# NUTS & BOLTS OF THE C/16

ANYONE WISHING TO DO EXTENSIVE machine code programming on the C-16 or Plus4 will require two essential pieces of information.

The first is a list of the operating system variables, their location and function. This is essential if total interaction with the system software is not to occur. It is also important to know where to place variables when using any of the system subroutines.

The second essential piece of information is a memory map. This contains the entry points to the operating system and Basic ROM routines. The use of such routines within a program can save a considerable amount of time and program space, an important consideration with the C-16.

I have included both these pieces of information in this article.

Unfortunately, Commodore has not previously produced any of this data and it has therefore been necessary to use the experience gained with previous Commodore machines to deduce the location and function of both variables and routines. All the locations discovered have been thoroughly checked and I have no reason to doubt that they are correct. I would however be very interested to hear from any readers with additional information.

The operating system variables are, in common with all Commodore machines, stored in the bottom area of memory extending from location 0000 up to the bottom of the screen colour memory at 0080, a total of 2K of memory. All the important variable locations are shown in Table 1. It should be noted that locations 0018 and 0019 are in I/O port location on the processor chip and cannot therefore be used for variable storage.

A memory map of the ROM based operating system and Basic routines is shown in Table 2. Many of these routines are usable to some degree, and some are extremely valuable. Most of the routines and variables are similar, or even identical, in function, if not in location, to those on the C64.

Readers wishing to gain an in depth knowledge of the routines, functions and operations are recommended to consult one of the advanced books on the 64. The 64 Revealed series by Nick Hampshire, published by Collins is recommended, especially *Advanced Commodore 64 Basic Revealed*.

Table 1

## Operating system variable storage.

0001	- Cassette control
Bit 4	: Cassette read
3	: Cassette motor (0=on)
1	: Cassette write
000A	- 0=LOAD,1=VERIFY
000B	- Type: 0=string,00=numeric
000E	- Type: 00=integer,00=floating
000F	- DATA scan/LIST quote/semi/flag
0014-0015	- Integer value
0016	- Pointer:temporary string stack
0017-0018	- Last temp string vector
0019-0021	- Temporary string stack
0022-0025	- Utility pointer area
0026-002A	- Product area for multiplication
002B-002C	- Pointer:start of Basic
002D-002E	- Pointer:start of Basic variables
002F-0030	- Pointer:start of arrays
0031-0032	- Pointer:end of arrays
0033-0034	- Pointer:bottom of strings
0035-0036	- Pointer:current string
0037-0038	- Pointer:top of Basic memory
0039-003A	- Current Basic line number
003B-003C	- CHARSET pointer
003D-003E	- Pointer:FOR/DO stack
003F-0040	- Current DATA line number
0041-0042	- Current DATA address
0043-0044	- Inout vector
0045-0046	- Current variable name
0047-0048	- Current variable address
0049-004A	- Variable counter for FOR/NEXT
004B-004C	- V save/0 save/Basic pointer save
004D	- Comparison symbol accumulator
004E-0053	- Misc numeric work area
0054-0056	- Jump vector for functions
0057-0059	- Misc work area
0051	- FRCB1 component
0052-0055	- FRCB1 mantissa
0056	- FRCB1 sign
0057	- Series evaluation constant pointer

Table 1(continued)

006B	- FRC#1 overflow
006C-006E	- FRC#2
006F	- FRC sign comparison
0070	- FRC#1 roundline
0075	- Room for graphics screen (0=not available)
007C-007D	- Pointer:GOSUB stack
0083	- Flag for window (#40=window on, #80=multicolour,#C0=both)
0090	- Status word ST
0091	- Keyboard C1A:STOP and RYS flags
0092	- G=load,1=verify
0094	- Serial output/deferred char flag
0095	- Serial deferred character
0097	- # open files
0098	- Input device
0099	- Output CHD device
009A	- Direct80/run80 output control
009D-009E	- Tape end address/End of program
00A2-00A5	- Jiffy clock
00A6	- Serial bit count/EOL flag
00A9	- Countdown tape write/bit count
00AB	- # chars in filename
00AC	- Current logical file
00AD	- Current secondary address
00AE	- Current device
00AF-00B0	- Pointer to filename
00B2-00B3	- I/O start address
00B4-00B5	- Alt start address (load/verify)
00B6-00B7	- Pointer:casette buffer
00C4-00C5	- Input cursor loc (row,column)
00C6	- Which key=64th key
00C7	- Input from screen/keyboard
00C9-00C9	- Pointer to screen line
00CA	- Pointer:cursor column
00CB	- Output quotes flag
00CD	- Pointer:cursor row
00CE	- Output character (to screen)
00CF	- # of inserts outstanding
00EA-00EB	- Screen colour pointer
00EC-00ED	- Keyboard pointer
00EF	- # chars in keyboard buffer
00F0	- Type of tape file
00FF-010A	- Floating to ASCII work area
0100-013E	- Tape error loc
0100-01FF	- Processor stack area
0200-0250	- Basic input buffer
0250-025A	- Pointer:line# for CONT
025B-025C	- Pointer:Basic statement for CONT
02F2-02F3	- Float-fixed vector
02F4-02F5	- Fixed-float vector
0300-0311	- Basic vectors

Table 1(continued)

0312-0313	- IR0 vector for keyboard/clock
0314-0315	- Main IR0 vector for sound duration/graphics split
0316-0317	- IRQ interrupt vector
0318-0319	- OPEN vector
031A-031B	- CLOSE vector
031C-031D	- Set input vector
031E-031F	- Set output vector
0320-0321	- Restore I/O vector
0322-0323	- INPUT vector
0324-0325	- Output vector
0326-0327	- Test-STOP vector
0328-0329	- GET vector
032A-032B	- Abort I/O vector
032C-032D	- User vector
032E-032F	- LOAD vector
0330-0331	- SAVE vector
0332-03F2	- Cassette buffer
0473	- CHARSET subroutine
04FC/04FE	- Duration for voice 1
04FD/04FF	- Duration for voice 2/noise
0503	- RND seed value
0509-0512	- Logical file table
0513-051C	- Device # table
051D-0526	- Secondary address table
0527-0530	- Keyboard buffer
0531-0532	- Start of usable memory
0533-0534	- End of usable memory
0535	- Serial bus timeout flag
0538	- Current colour code
Bit 7 : I-flash	
6-4 : luminance (0-7)	
3-0 : colour (0-15)	
053F	- Maximum size of keyboard buffer
0541	- Repeat speed counter
0542	- Repeat delay counter
0543	- Keyboard shift/control flag
0544	- Case switch count
0545-0546	- Keyboard table setup pointer
0547	- Case switch disable
0700-0700	- Bomb attack
07F2	- SVS A res save
07F3	- SVS X res save
07F4	- SVS Y res save
07F5	- SVS status res save
07F6	- Last key
07FD	- Countdown for double TI bus
0800-08FF	- Colour memory
0C00-0FFF	- Screen memory
1000-3FFF	- Basic program memory
1800-3FF5	- Grayscale screen/colour memory
3FF6-3FFF	- Reset entry (when ROM is out)

Table 2

## Commodore 16 Memory Map.

0000	- Basic ROM cold start routine	966C	- Constant - 32769
0019	- Initialize Basic	966E	- Float-fixed
00CC	- Power-up message	9662	- Performs 'FRE'
0105	- vectors for #0300	9673	- Performs 'F03'
0117	- Initialize vectors	9690	- Performs 'DEF'
0123	- GOSUB for #0479	96DE	- Performs 'FN'
010E	- Keywords	9666	- Performs 'STR#'
0383	- Command vectors	9C49	- Get temporary string
0415	- Function vectors	9C88	- Performs 'CHAR'
0453	- Arithmetic operator vectors	9CCF	- Performs 'LEFT'
0471	- Error messages	9D83	- Performs 'RIGHT'
0681	- 'SYNTAX ERROR'	9D15	- Performs 'NIB'
0683	- Error routine	9D61	- Performs 'LDV'
0703	- 'READY.'	9D79	- Performs 'RSC'
070F	- Basic warm start	9D84	- Get 1 byte parameter
08CD	- Find Basic line	9D93	- Performs 'VVL'
0A79	- Performs 'H04'	9D02	- Get parameters for POKE/WAIT
0A90	- Performs 'CLR'	9DFA	- Performs 'PEEK'
0AF1	- Set text pointer	9E12	- Performs 'POKE'
0AFF	- Performs 'LIST'	9E6A	- Performs 'WAIT'
0B0C	- Performs 'RUN'	9E87	- Performs 'subtract'
0C9A	- Performs 'RESTORE'	9E9C	- Performs 'add'
0CD0	- Performs 'STOP'	9B1E	- Performs 'LOD'
0CDA	- Performs 'END'	AD79	- Performs 'multiply'
0D03	- Performs 'CONT'	AD97	- Performs 'divide'
0D2C	- Performs 'GOSUB'	AD21	- Memory to PEEK
0D4D	- Performs 'GOTO'	AD81	- PEEK to PEEK
0D83	- Performs 'RETURN'	AD90	- Round PEEK
0D80	- Performs 'DATA'	AD8E	- Performs 'S04'
0DE1	- Performs 'IF'	ADDD	- Performs 'R03'
0E00	- Performs 'REDI' and 'ELSE'	AD98	- Performs 'INT'
0E1B	- Performs 'ON'	AD84	- Performs 'S08'
0E3E	- Get line number (0-65535)	AD8E	- Performs 'eover'
0E7C	- Performs 'LET'	AD27	- Performs 'rebase'
0F09	- Performs 'PRINT#'	AD69	- Performs 'EXP'
0FDC	- Performs 'CHI'	AD87	- Performs 'R08'
9000	- Performs 'PRINT'	AD7D	- Basic I/O error handler
9009	- Print string from (v,a)	AD95	- Basic-kernal match for OPEN
9080	- Performs 'GET'	AD8D	- Basic-kernal match for PRINT
90EE	- Performs 'INPUT#'	AD91	- Basic-kernal match for INPUT
9100	- Performs 'INPUT'	AD97	- Basic-kernal match for set output device
914F	- Performs 'READ'	AD96	- Basic-kernal match for set input device
9209	- 'READY FROM START' message	AD9F	- Basic-kernal match for GET
9204	- Performs 'NEXT'	AD83	- Performs 'S05'
922C	- Evaluate expression	AD8E	- Performs 'S06'
9439	- Constant - 41	AD78	- Performs 'VCRIFY'
9435	- Performs 'NOT'	AD73	- Performs 'LOAD'
948B	- Scan next '>'	AD4D	- Performs 'OPEN'
948E	- Scan next '<'	AD5A	- Performs 'CLOSE'
9491	- Scan next ','	AD6B	- Get parameters for LOAD/SAVE
9570	- Performs 'OR'	AD80	- Get parameters for OPEN/CLOSE
957B	- Performs 'AND'	AD84	- Surface collect
9620	- Performs comparisons (<=)	AD70	- Performs 'COS'
963B	- Performs 'DIV'	AD77	- Performs 'SIN'
969D	- Local variable	AD6D	- Performs 'TAN'
		AD1A	- Performs 'RTH'

Table 2 (continued)

AB8D	- Performs 'NUMBER'	D865	- Input until carriage return
AD0A	- Performs 'FOR'	EB11	- Read keyboard
AE50	- Performs 'DELETE'	EC49	- Output to screen
AECh	- Get range for LIST/DELETE	ED1E	- Keyboard select vectors
B42B	- Performs 'TRAP'	ED26	- Unshifted table
B44B	- Performs 'RESUME'	ED67	- Shifted table
B544	- Performs 'PUDEF'	ED68	- CBI line table
B557	- Performs 'DO'	ED69	- Control table

This month A.P. and D.J.

Stephenson provide the key

to Basic and delve into the

mysteries of keywords.

SOME READERS WHO HAVE BEEN following this series may have found the last few articles a little tough. This month, we thought it would be nice to pause for breath and go over some of the basic used BASIC keywords in detail.

The Basic language, as implemented in the C64, employs a variety of keywords which are sufficient to cope with most situations. A good proportion of the total are in constant use and have been treated and used in earlier articles in this series. For various reasons we have neglected some of them altogether. A few others have been used without adequate description. Although all keywords are defined in the user manuals, alternative treatments can often lead to a better understanding.

The vocabulary of any language is seldom utilised to the full. Indeed, in everyday speech, we only use a fraction of the total number of words we know. It is the same with programmers. However rich the Basic vocabulary, it is easy to get into a rut by sticking only to those keywords which are easy to understand or use. Unfortunately, the most astute adviser of the C64 or Vic II would be loath to admit that the Basic vocabulary in these machines is, to say the least, sparse. Because of this, it is particularly important that we know how to make efficient use of every keyword. Before dealing with them individually, it pays to classify them into order.

## Types of keyword

A keyword is any combination of characters, chosen for their mnemonic value, recognised by the interpreter as an order to be carried out. They fall into one of three classes - statements or functions.

Commands are keywords which have an overall effect on the complete program. They are most often employed outside a program in direct mode. However, they will also work within a program under a line number. The following keywords are direct commands: CONT, LIST, LOAD, NAME, RUN, SAVE, VERIFY.

Statements are keywords which perform some particular action within a program. Most keywords are statements.

Functions are specialised statements which perform a standardised operation on a variable. Functions can be

# T.H.E. BASIC F.A.C.T.S

recognised by the brackets which enclose the variables. The following complete list of Commodore functions uses X or Y as example numeric variables and A4 for string variables: ATN(X), CHR\$(X), COS(X), EXP(X), FRE(X), INT(X), LEFT\$(A4,X), LEN(A4), LOG(X), MID\$(A4,Y), PEEK(X), POS(X), RIGHT\$(A4), RND(X), SIN(X), SPC(X), SQR(X), STR\$(X), TAB(X), TAN(X), USR(X), VAL(A4).

TI and TO are exceptional in that Commodore classifies them as functions although they do not require brackets round the variable. Numeric variables used in functions are often called arguments. The arguments in two of the functions, POS and PEEK, are dummys, meaning that some number must be entered to avoid triggering a syntax error although it doesn't matter what number you chose within the range 1 to 255.

## The command RUN

RUN clears all variables when it starts a program from the first line number. It is possible to start a program from lower down the program by using RUN X, where X is the starting line number. RUN X will often lead to error conditions because variables created under previous line numbers are cleared from memory.

If you want to restart the program a second time at some lower point, it is better to use GOTO X which leaves previously created variables unchanged. The main danger with using GOTO X is triggering a "DEBRATED ADDRESS" error if a GOTO line is re-encountered.

## The command CONT

A program comes to a halt under any one of the following conditions:

- The RUN/STOP key has been pressed.

- The program has reached either a STOP or END statement.
- The program has reached the last line number.
- The program has encountered a standard error condition.

The program can always be restarted from the beginning or, by typing RUN X, started from line X. However, RUN or RUN X always clears variables from memory which were created by the last run. Only the program is retained.

The command CONT can provide a powerful weapon for writhing out bugs in a program during the development stage. It is usually possible, providing the development has proceeded in accordance with guidelines of good structure, to recognise certain critical points in a program.

To check the value of variables at these critical points, temporary STOP instructions can be inserted. When the program is RUN, it will halt at the first STOP and you can check the state of the variables by printing out their value. If the values are different to what you expected there is a line point in proceeding with the rest until the reason for the discrepancy has been found. Assuming that everything is OK, you can allow the program to carry on with the next segment by again using CONT.

Unlike RUN, which always starts the program anew, CONT allows it to carry on from where it was stopped and preserves the value of all variables reached up to that point. These temporary STOPs act as 'break points' in the program, enabling the areas to be investigated and faults remedied in a series of easy steps.

To take full advantage of break points, the program should be fixed, easy to use, where the results of calculations can easily be checked manually at the end of each one. Remember that CONT will not

work. If the program has halted due to an error condition, if you try it, the response will be "CAN'T CONTINUE."

## The command NEW

As far as Basic is concerned, the command NEW will clear the entire memory, including any pre-existing programs. Although NEW is usually entered in direct mode, you may include it within the program under a line number. If you start on a new program when the previous one or its remnants are still in memory, be prepared for some unexpected results. Switching OFF and ON again will clear everything, but entering NEW is more elegant.

Authorities disagree on the wisdom of repeatedly switching the power on and off more than absolutely necessary. Repeated use of the main switch may even reduce the life of some of the more sensitive chips.

## The command LIST

This is probably the most overworked command in Basic. Although the default listing is to the screen, a previously active CMD statement can be used to output the listing to a printer or other suitable peripheral.

You may include LIST within a program under a line number but, after the listing, the program will always revert to command mode and the READY message. Unless it is placed at the line immediately preceding the END statement, it is difficult to imagine what purpose LIST can serve within a program other than saving you the trouble of entering LIST afterwards. But then you don't always want a listing after every run!

## The command SAVE

This command can only be used to save programs. It saves on tape by default or on disc by quoting device number right after the program name. The Commodore method of saving on tape is slower than some other machines, partly because two copies are always saved so that read errors or playback are easily pinpointed by discrepancies between the versions.

If SAVE is used within a program under a line number, the program is halted while the tape or disk is being recorded, can completion of the save operation, it continues on with the rest of the program. In this way, it is possible to save a program and run it in one go, although you'll probably never need to do this.

Figure 13.1

readers program which may be there. If LOAD is used as a statement within a program, although the running program is cleared, the existing variables are untouched and a BASIC automatically follows. Used in this way, the LOAD command acts as a "resume" command so that several programs on tape or disk can be chained together. This allows large programs which would exceed the bounds of memory, to be entered in parts small enough to be accommodated within the memory space available. Each subsequent program finds an environment already prepared by previous programs. The individual smaller programs must be carefully designed to ensure that, apart from their use of existing variables, they are self-sufficient.

For example, one program cannot GOTO a line number of another because it would not be in the computer's memory. The program bytes are normally loaded into a block of memory starting at address 2048 (2000 hex) onwards.

## The VERIFY command

Realists use VERIFY immediately after they have saved a program on tape. It takes a long while to save a large program and just as long to verify it afterwards so it is a precaution which many programmers neglect to take. In any case, the most likely reason for failing to LOAD is an error during playback rather than during record.

However, VERIFY does have one additional advantage. Because it loads the tape several inches after the program's end it is safe to remove another program immediately without worrying about overlap.

## POKE and PEAK

These two statements are best considered together because they occupy a grey area, midway between Basic and the inner

workings of the machine. In traditional Basic, the individual pigeon holes in memory are of no consequence because the computer takes care of all memory assignments.

POKE() enables us to have a look at the byte currently occupying memory address X. To avoid an "INVALID QUANTITY" message, it must be within the range 0 and 255. (There is no necessary outside this range.)

POKE X,Y allows us to store the number Y in address X. Since a memory location can only hold one byte of data, Y must be within the range 0 to 255, and it must be a positive number.

To PEAK a number can never be harmful but an indiscriminate POKE can turn sour. Poking the right number into the wrong address or vice versa crash a program. The results of a crash vary but it's usually either a scorching of scrolling screen characters or a noisy indifference to all keyboard activity. The crash will almost certainly occur if a number is poked into one of the workspace areas used by the operating system.

You should regard the operating system with respect as it's capable of withdrawing all co-operation if crossed.

Providing care is taken in choosing memory addresses, POKE can be used to:

- Assign data bytes directly, for example, it can maintain store numbers less than 256 in memory. It can be done more economically by using POKE then by assigning the number to a Basic variable. It is not so convenient or flexible as normal assignments but worth bearing in mind when a lot of small numbers have to be manipulated.
- At one of the elements in graphic work.
- Passing parameters to machine code routines called from within Basic.
- In spite of the warning regarding a POKE into operating system areas, there are a number of special

When you load a program using LOAD as a direct command, all variables are cleared from memory including any

locations which can be **POINT** in order to modify certain effects.

- (H) To control colours, **POINT \$1000** will set background colour to orange.
- (I) It is possible to operate on selected bits of a memory byte by using the **AND** or **OR** operators in conjunction with **POINT** and **PLUS**. For example, bit 4 in location **\$3270** decides whether the multi-colour character mode is on (bit 4=1) or off (bit 4=0). To ensure the off condition, use:

```
POINT $3270,PLUS($3270) AND 239
```

This may seem a trifle obscure unless you are familiar with the bitwise features of **AND**.

### The AND statement

It should not be difficult to understand the meaning of **AND** and **OR** when used in conjunction with the **IF/THEN** structure, for example:

```
100 IF A < B AND C < D THEN PRINT A
```

The context is almost self-explanatory and clearly means that both conditions must be true. However, there are other, less obvious, qualities lurking beneath the surface which are known as **bitwise** operations. Study the following series of operations:

```
Assume this pattern      11011001
Now AND it with          11011111
The result is            11001001
```

Note that the result is the same as the original pattern except where the **AND** pattern had a 0 in that position. The **AND** pattern, known as a **mask**, is calculated thus: Use '1' in the mask when you want '1's in the result, otherwise use '0's.

Let's try a practical example. Suppose a certain memory location holds the following bit pattern:

```
10011000
```

Let's also suppose that we wish to clear bit 4 (without disturbing the others, bits are numbered 0 to 7, from right to left so bit 4 is the fifth bit from the right). The correct **AND** mask will be **11011111**. Unfortunately, there is no provision in **QBASIC** for entering bit patterns direct. We have to use decimal so we must convert the bit patterns in the **AND** mask to decimal before it can be accepted. The above example required an **AND** mask of **199**.

Working laboriously in decimal, this becomes  $1 \times 2^4 + 0 \times 2^3 + 1 \times 2^2 + 1 \times 2^1 + 0 \times 2^0 = 199$ . Pity Commodore doesn't provide hex numbers - this would make **AND** mask calculations dead easy.

We are now in a position to return to the problem we left in the last section. You will remember that the following line

was supposed to clear bit 4 in location **\$1270** to 0:

```
POINT $1270,PLUS($1270) AND 239
```

We are polling the same bit pattern back into the location after we have **AND**'ed it with 239. We know that 239 decimal is **11111111** which is the correct **AND** mask for clearing bit 4 in the original location. To consolidate, confirm that the following apparent abnormalities are in fact quite true:  $247 \text{ AND } 231 = 231$ ,  $7 \text{ AND } 0 = 0$ .

### The OR statement

This, like the **AND**, has bitwise connotations. As we have seen, **AND**'ing is used when we want to clear certain bits to 0 but **OR**'ing is used when we want to set certain bits to 1. The rule for the **OR** mask is a follows: Use '1' in the mask where bits are to be '1's, otherwise use '0's.

```
Suppose we start with      11001011
Then we OR it with         00010000
The result is               11011011
```

Note that the result is the same as the original except in the position where there was a 1 in the **OR** mask.

Let's return to our previous example once again for this time, assume we want bit 4 in location **\$3270** to be a 1. The **OR** mask must be **00010000**, which in decimal is 16. Our **POINT** line then becomes:

```
POINT $3270,PLUS $3270 OR 16
```

To consolidate, confirm the following:  $7 \text{ OR } 7 = 7$ ,  $5 \text{ OR } 2 = 7$ .

### The NOT statement

This is the third member of the trio capable of bitwise operations. Before describing its action, we must first define a few terms: To **flip**, means to change a 1 to 0 or vice versa. The **bit complement** (logical complement or one's complement) is the bit pattern formed by flipping all the bits. The **two's complement** is the same as the **bit complement** except that an extra 1 is added. Example:

```
Starting with      10010111
Bit complement is  01101000
Two's complement is 01101001
```

The **NOT** statement forms the two's complement of a bit pattern which can lead to rather mysterious results. For example, **NOT 1 = 255**. To see why, note that  $1 = 00000001$  so the two's complement is **11111110** + 1 = 255.

The mystery clears up when we learn that a negative number, as far as the computer is concerned, is really the two's complement form of the equivalent position. When we **NOT** something, we are really asking for the negative version.

All this information on the bitwise operations of **AND**, **OR** and **NOT** is really crossing the border between **Basic** and machine code. The same thing can be said regarding the next item.

### The SYS command

It is possible to mix **Basic** with machine code in the one program. There are several situations where such a mix may be justified. The execution speed of **Basic** is sufficient for some purposes but intolerable for others. Another disadvantage of **Basic** is that memory is not used economically. For example, in **Basic**, the memory set aside for numbers is fixed, irrespective of their magnitude. It takes just as many bytes to store the number three as it does to store 5000. Machine code programs can arrange for memory storage to be more closely tailored to magnitude.

However, machine code is not everyone's idea of the good life so, as far as possible, most of the program may continue to be written in the tranquil environment of **Basic**, with only the occasional leap into and out of machine code. Figure 11.1 shows how such leaps can be performed using the keyword **SYS**.

Note from the figure that we can only jump to a machine code sub routine if we happen to know where it is located in the memory map. In other words, we must know the starting address. If you've written the machine code there's no problem but you may want to use some of the ready-made versions already residing in the **ROM**. These are lots, providing you find out the starting address by consulting the Programmer's Reference Guide or employing some truth detection work. Remember you can always **PLUS** locations in **ROM**.

There is one obstacle that can arise in the use of **SYS**. Many subroutines only work if information is provided. To quote a simple example, a subroutine to find the square of a number obviously can't work unless it is supplied with the number to be squared. When such a subroutine is written, it will assume the number to be already residing in a particular memory location. The address will form part of the accompanying documentation.

Therefore, before we call on the subroutine by means of **SYS**, we must pass this information in the required address. These typical call might look like this:

```
100 POINT $4520,0
110 SYS 34580
```

The data location is **\$4520** and the number '0' has been passed into it. The subroutine is assumed to start at address **34580**. The machine code subroutine must end with **RTS** (return from Subroutine) otherwise control will not come back to **Basic**.

Our resident expert  
answers your  
programming queries.

## INPUT

Most computers with function keys enable you to redefine the keys in BASIC. I have been trying to do this for some time on my C64 but without too much success. Could you possibly tell me how this could be done?  
Norman Doyle  
Cleveland

## OUTPUT

Unfortunately, as you have no doubt found out, there is no simple way to define the C64. Most Basic extension packages (see our August and September issues) have a command which allows you to program keys by means of a new keyword. It is however quite simple to use these keys in your own programs without having to go to any expense. Take a look at the following short program:

```
10 GET A$
20 IF A$ = CHR$(10) THEN 10
30 IF A$ = CHR$(14) THEN 10
40 A=ASC(A$)-1073-1074-1
50 PRINT "FUNCTION KEY
  "A" IS PREPARED"
60 GOTO 10
```

This short routine will scan for all eight function keys. By adding the following line it is also possible to add four function keys by using the Commodore key as an extra shift key.

```
45 IF PEEK (A$)=2 THEN
  A=A/24
```

Including the function keys in this manner is extremely simple as each of the keys returns a unique number to the GET instruction in line 10.

Below is a program which will allow you to actually store strings of characters on each key, the strings can either be keywords or strings of your own choosing.

Various re-definable keys are returned for and these are obtained by pressing F1/F2/F3

and F7 with no shift, the Commodore key as the control key.

The whole program is based on interrupts and can be switched on by:

```
555-49103
```

and off by:

```
555-49102
```

When the program is first loaded the keys are set to:

```
F1 555-49108
F2 555-49108
F3 8104 + RETURN
F4 POKE
F5 LIST
F6 PRINT
F7 LIST + RETURN
F8 555-49102
F9 8104
F10 8104
F11 8104
F12 8104
F13 5344
F14 5477
F15 1040
F16 SAVE
```

The function of each key can be changed by either pressing F1 or typing 555-49108 followed by the text in quotation marks, a comma and then the key number. The text stored on each key can be no more than 10 characters and the key number no greater than 16. F1 and F2 cannot be changed since they build the important 555 calls.

Here are a few examples:

```
555-49108 "F1=8104/L",7
```

This will POKE 8104 with 8.

```
555-49108 "LOAD="CHR$(34)+
  "F"=CHR$(34)+9="",3
```

This will type LOAD "F",8 and execute a return.

If you wish to add a RETURN onto the end of any function you must put a left hand arrow as the last character in the text when defining the function.

Below you will find the BASIC source file and a basic loader.

## Frankie Goes to Hollywood

★★★★  
Ocean  
\$29.95  
C&I

FRANKIE COMES TO CRICKLEWOOD, or anywhere else for that matter, packaged in a smart box with a live live recording of the band performing their hit song Relax so you can breeze while you play your next move in the game.

As programs go, this has a lot to offer and the inclusion of games within games reminds me slightly of Terminal's Larry Jones but this has all the whistles and bells that Jones lacks. It is streets ahead of any opposition and that's not just because it's set amongst the houses of Mundaneville.

The idea is to reach the title screen, a typically canty Frankie-style idea, to do this you have to visit all the houses in every street of Mundaneville to find objects which will help you to complete the mini games. Really the things people keep in their drawers! Old fish, pleasure pills, greasy and valero capsules.

Talking of valeros, these play a vital part in the story. Place a cassette in a handy video machine and it reveals a portion of one of the mini games. You are then free to enter the screens...but I'm giving away the plot.

Why do you have to enter the mini games? What is the fiendish purpose behind it all? Before you can enter the final screen you must complete your personality. For the purpose of the game, personality is composed of four facets: pleasure, wit, love and faith. Each facet is represented by a symbol at the right hand side of the superb 3D graphics screen and each pleasure pill looks like the symbol in which it relates. As the game progresses you gain points in one or more of the

Here's your chance to get some help from the experts on how to spend your hard earned pocket money.

screens for successful results and lose points for failure in the mini games. This is shown by growing and shrinking columns above the relevant symbols. Points are also awarded for various finds in the houses. Occasionally, Frankie will interrupt with a comment which tells you how your personality is developing as a percentage just to cheer you along.

One of the rooms has a locked door which is the entrance to the Corridor of Power earning the Pleasure Borne. This is where the mini games are located and once you have unlocked this door, mapped the maze and fully developed your personality the final door will be found here, but be careful the maze of corridors is full of traps for the unwary.

In one of the houses there has been a murder and once you have discovered the body you are given clues to the murderer's identity and you must not re-enter that room until you have discovered who the felon is. Each time you play the game you will find a different corpse and a new killer.

I will not reveal the nature of the mini games except to say that there are more than 75. Ocean claims that there are 60 problems to solve in all and I believe it. After hours of searching and battling the best rating I achieved was 60% personality. In my opinion this game should rank alongside the best C&I titles and every owner should have it in their collection. J.G.

## Lords of Havoc

★★★★  
Microdeal  
£6.95  
C&I — joystick optional

A MULL, SCORPIONS AND SPIDERS. A ghostly graveyard and gartles, knights in castles and chests are some of the things you will encounter in the Lords of Havoc.

Sador (the player), a noble in the shape of a man, has come to save the land of Havoc from the Dark Lords. His first quest is to seek the Book of Change hidden deep in the village. The Book will reveal the whereabouts of the chest which contains directions to the Dark Lords.

Sador will have to fight and kill to collect the means to protect himself, such as a Talisman from the Bytians and a key from the Gardens, before he can enter the Skull in the Wild Wood and destroy the Dark Lords. If he stays into the Wild Wood too soon he will become paralyzed

at end of game! Only after many hours of play will the final secrets of the Dark Lords be revealed.

This master type game is of the Salvo Mini variety. Nine cards map out the maze when laid in sequence (2000 combinations). Half the fun is finding the aim of the game and the other half is arranging the cards in the correct sequence at the beginning of each game (this happens very often, until you become experienced). The bottom right-hand corner of the screen has the initials of each card in the pattern they are set out on the table. The predefined character set makes them almost indecipherable and the pattern is unclear as two of the cards have the same initial.

Once defeated the player is informed of his percentage through the game before being inducted in the Hall of Fame (if he's lucky). The game loads in under three minutes and has high quality graphics. There are eight levels of play, each with an easier/difficult option. The music is excruciating and should be turned off immediately using the F1 key.

## Triangle

★★★★  
Angus Press Software  
£19.95  
C&I — disk only

WITH THE AVAILABILITY OF CHEAP printers, so-called business software is being bought increasingly for home use, and here we have a fully integrated word processor, database and spreadsheet package at an incredibly low price!

The program is very comprehensive and easy to use, although the slender "manual" provided with it would be woefully inadequate to anyone unfamiliar with the processes involved. This is a shame, as the software is unbeatable in terms of pure value for money.

The wordprocessor uses the standard 40 columns screen, with words being broken off at the end of lines as you type. This is corrected at the printing stage, but it does mean that you cannot see the finished article on the screen before

# Here and There with the Mr Men

\*\*\*  
Microsoft  
\$7.99  
CIB

HERE WE HAVE A SLICE OF FOUR-PIC: game intended to give four to eight year olds practice in distinguishing left, right, up and down - a concept young children find difficult. An element of route-planning is also involved. The popular Mr Men are used throughout and the graphics, though simple, are very effective.

In Mr Tickle's *Figure-Around the U.D.I.* and *8 Keys for the function keys* are used to move downwards in the sides of a box until they are lined up with pieces of a figure puzzle which stand outside. When the alignment is correct the pieces move in and build up a picture of Mr Tickle. The figure pieces are very small and do not line up conveniently with the doorways, so the

printing. Special commands are accessed logically and easily using the (Ctrl) key, and most of them work very well. A slight problem is that only whole lines of text can be highlighted and moved, but I did not find this a major drawback. Tabs, also, were a bit quirky at times.

Part of the machine's memory is set aside as a "clipboard" or workpage, so that chunks of text can be merged at will, and there is an option for printing globally, so that whole documents may be linked together in sequence. A wide range of printing options is provided, including centering and justification. These are accessed through the familiar "format lines". There are also built-in commands for underlining and italic printing, available on lipson and similar printers, though these are deprecated in the manual.

The database is almost the easiest to use that I have seen though it is somewhat limited. The program will sort records into alphabetical or numerical order. Nor is it possible to view through a window file, unless you use one of the 12 prewritten fields as a dummy, and just to

game becomes harder than need be. Children whom I asked to try it soon found it tedious.

Mr Tickle and Mr Grumpy are the other hand, is excellent and quite the best of the four games. Mr Grumpy is inside the box with the three-hour doorways and Mr Tickle's extending arm needs to reach in to tickle him. To achieve this, the doorway can be moved as before, then Mr Tickle must be programmed with a sequence of instructions for moving his arm along the required route. On later levels, chains appear in the doorway, adding to the challenge. If preferred, the directions for movement can be given individually.

In Mr Lary the idea of branching to left or right is introduced as *ploughing a worm up a tree to a red apple*. If you are successful he will drop the apple into the mouth of Mr Lary, who is sleeping below. Another good game.

Mr Men versus Mr Tickle is the poorest of the games in that it is almost impossible to lose. You control four Mr Men, moving on a diamond board, who try to trap Mr Tickle. It could be quite good, but unfortunately Mr Tickle's movements are often rather stupid and he rarely wins.

Taken as a whole, the program is fairly good, though nothing special. It is certainly not up to Microsoft's usual standard of educational games.

P.B.B.

access the records. Nevertheless, as a single address book or similar database it is very good and has a particularly versatile procedure for print forwarding.

The spreadsheet, or financial planning section of the program is excellent, although it is here that the novice would find most difficulty in following the manual. A rather involved system of relative addressing is used when entering formulae, and the explanation given is very thin indeed.

All the sections of the package are fully integrated, so database and spreadsheet files can readily be incorporated into wordprocessor documents. If you run into difficulty, a "help" key is provided, which puts an explanatory window on the screen. The information given, however, usually just duplicates the inadequate text of the manual.

With proper documentation, tutorial and sample files this package would warrant five stars. As it stands, it is still very good, especially when you consider that it is only a quarter of the price of comparable software. Well done, Apple! P.B.B.

# Cave Fighter

\*\*\*  
Mikolite Inc.  
\$6.95  
CIB - joystick or keyboard

I HAD TO BORROW TWO CASSETTE players before I finally managed to get this game to load - and then only from one side! It's a slow loader (jvms) so this doesn't seem to be any real reason for this. However, I succeeded in the end, so here goes!

You are deep in the heart of a system of caves, from which you are trying desperately to escape before your energy is exhausted. The caves are infested with bug-eyed monsters, bottomless lakes and pits filled with what look like sharpened stakes, contact with which spells instant death! Fortunately you have nine lives, like a cat, but I guarantee that you will need every one of them.

To escape you will need to run, jump, shin up ropes and shoot aliens - in fact it is a fairly standard platform game, with a scrolling screen display, the controls are rather unusual, as you jump only after you release the fire button - the height varies according to the length of time you hold the button down. Shooting prevents no problems, as you fire automatically in whichever direction you are moving.

There are eight levels, with six caves in each level, and getting through is really challenging!

The graphics are excellent, though the colours are rather muted. Some of the aliens are especially good and move very smoothly, almost like spiders. The side page displays the three highest scores and gives the option of returning at the level reached in the previous game. It is accompanied by a rendering of the Star-Spangled Banner in very exotic tempo. Generally, the sound effects are poor - I ended up turning the volume right down.

The game is quite good, but doesn't really shine in any way, and I quickly tired of it.

P.B.B.

# Software Spotlight

## Morden's Quest

★★★★  
Melbourne House  
£15.95  
C64

I'M A "BLAST THE GRIEF OUT OF ANYTHING THAT MOVES" addict, so when I was asked to review this adventure I thought the intergalactic battle was over, so you can imagine that I loaded *Morden's Quest* with some trepidation, especially as there wasn't even the slightest hint of any graphics. I was in for a more than pleasant surprise.

*Morden's Quest*, by Melbourne House, has been written by Peter (don't you dare give my phone number to anyone) Morland, who also wrote *Classic Adventure*.

It is said by the publishers to be "an extremely complex text adventure". They were dead right about it being text but they were definitely being underhanded by using the word "complex". I would think up much more graphic superlatives to describe its twists, turns and generally dastardly tricks and absolutely mind-bending puzzles. As I said, I could be much more graphic in my description, but this is supposed to be a family show!

Like any other text game the computer acts at your eyes, ears and hands and is only limited by the 500 words which it understands, which, when you come to think about it, is an awfully large vocabulary. However, this has been accomplished by using that well known "text compression" system allowing the author to be very descriptive as you travel through the 150 locations which have been cleverly mapped to look like... but that would be telling. Typing in 'help' will point you in the right direction.

The game starts with you, as the possible answer to any jock-the-lad wizard's prayer, falling out of bed. Your quest is to save the universe, as if you hadn't guessed already.

On your journey you will come across tall wizards, homicidal ninjas who are heavily into magic mushrooms, and lots of clank clad, human apes, with a strange sense of humour, to name but a few. All you've got to do is collect several parts of a machine which will defeat the roving and heinous *Badster* who is bent on immortality at the expense of our total destruction.

All this is delivered in such a way that you could be forgiven for believing that you're actually there. I told you that, this game with its brilliant descriptions of sequences, events, and locations has got to be a must for any software library, even if you think your home is "it's moves, lunk in".

Go out and buy this, you will know it made sense.

## Tour de France

★★★★  
Activision  
£15.95  
C64 + joystick

SOFTWARE THAT GIVES A LIMITED amount of French lessons is the latest offering from Activision. Based on the *Tour de France* bicycle race the game boasts some interesting and well planned graphics. I was particularly impressed with the bicycle movements which allow you to pedal movement in any direction as the route demands. With each slight movement the sprite appears to change shape accordingly giving an extremely convincing 3D effect, probably the best I have seen.

The game is complex to load because you are given the choice of completing the full *Tour* or selecting individual stages which are then loaded from data sections on the tape. This means that once you have completed your chosen selection a new game involves reloading the whole program again. Not knowing how the program was written I do not understand why it is not possible to be able to reload the data section of the tape and reload a new selection. No doubt there is a reason but I would have preferred it to be otherwise.

Another little quibble relates to the fact that although the race can be controlled by the keyboard, the selection of bicycle and country of the player must be made with a joystick. Surely a small amount of extra thought could have released the user from the need to use the joystick at all. I found that the response from the keyboard was better than that from the joystick and that the control of the bicycle was easier.

Having got those gripes out of my chest I shall continue with my description of the game. Up to six players can enter the race but each must complete a section in turn. Why the programmer bothered to include the option for a practice mode I do not understand because once practice

mode is chosen you must reload the tape to switch to competition mode. I found that by selecting competition mode with six players gave me plenty of time to experiment with different types of cycle and perfect the technique of staying on the road.

To pedal your bike you must press two keys alternately or wobble the joystick back and forth. The energy expended to do this will not give you wrist ache like some sport simulations but it does make you concentrate. Direction is controlled by two separate keys or by moving the joystick left or right with the fire button pressed and you can even select one or two gears as the terrain demands.

French is used throughout the program but most of it can be deduced without any prior knowledge of the language and who knows you may learn a thing or two.

At the beginning of each stage (stage) a screen is given which allows you to select keyboard or joystick operation and it also permits you to select another bike. Each bike has different qualities but it is up to the user to find out what these are.

This means that if you want to change your mode of control or try a new vehicle in mid-race you can do so at the next rest point between stages.

When I first played this game I thought it was dull but when I discovered the target time for each section on the title screen for each stage, I became engrossed in pedalling like fury avoiding collisions with the gas, verge so that I didn't waste time jacking myself and my bike up off the floor in an attempt to beat the record time. This added a distinct edge to my one player game and I can see how the multi-player game could become addictive.

At the end of the game you can load a summary screen which displays each player's overall score and gives a breakdown of individual performances. I'd like to say more but it wouldn't suit my vision so I'll take Activision's word for it.

## Nick Faldo Plays the Open

★★★★  
Mind Games  
£15.95  
C64

AMAZE YOUR FRIENDS ON THE 19TH tee with the casually dropped remark, "I hit a 71 at the Royal St George's Club in Sandwich this morning".

Club athletes and armchair critics alike should enjoy taking up the challenge of

one of the most difficult courses in the country.

Using either the keyboard or joystick you can view a detailed plan of each hole so all you need to do is select the right club (with guidance from your caddy), pick the direction in which you wish the ball to go and choose the appropriate amount for the required distance you wish the ball to travel. Then, adjust for wind direction and speed and hey presto your animated golfer will hit the ball. It all that sounds a bit too easy for you there is

### Sword of Destiny

★★★★  
Gremlin Graphics  
18/95  
C16 or Plus/4 — joystick (optional)

THIS GAME HAS AN UNUSUAL STORY-line in that you start off dead! You play the part of Kelak — not the cornflake manufacturer but the well-known warrior of the Eastern Angles. No, you don't work for Anglia Television either!

You have been killed by Xosphas, a warlock of the worst kind, and he has stolen your heart away. "Have a heart!" you yell, and he just teak it, doubtless to use in some of his unnatural practices! So you are doomed — doomed to wander forever in the Abyss of Death, doomed to the torment of death without peace. Somewhere in the succession of eerie scenes lies your lost heart, which you must regain if you are ever to find rest.

To help you in your quest, you are armed with the famous Sword of Destiny. A strange sword, this, as it hurls bones at people — or perhaps they are thunderbolts. You use it to dispatch the vile guardians-of-death, an assorted bunch of bats, ghosts and grinning skulls, and by sending them packing you replenish your energy a little. Collect any flanking objects and you open up further cave sections, but do watch your energy, or your power level. You only have one life, or rather death, to play with.

To sum up, you must run about and jump from level to level, collecting anything which flashes and bleeping off ghosts, ghoules and things that go bump in the night, trying to find your poor bruised heart. The task isn't easy — it took me several attempts before I even qualified for the high-score table — but at least you get some help from the hot-air flues, which enable you to leap to amazing heights!

Here we have yet another great game from Gremlin Graphics — it's well worth buying.

P.B.E.

### Dark's Dilemma

★★★★  
Gremlin Graphics  
18/95  
C16 or Plus/4 — joystick (optional)

DARK, AS EVERYONE KNOWS, COMES from Darking, but this one is far from the heart of rural Surrey. His spaceship has crashed on the planet of the Zobowats and is scattered to the four winds, or at least to the 25 mazes. "What is a Zobowat?" I hear you ask. Elementary, my dear Watson — it is nothing more than a flawber spell backwards, but it can take many forms, all of them nasty!

If you are wondering whatever I am darking about, let me explain. The aim of the game is to collect a piece of spaceship from each of the 25 chambers, then reassemble them. To collect these components, all you need to do is to kill a minimum of 10 Zobowats in each chamber. The method of killing is easy. You drop a bomb when they are close to you, then you dark out all the way pretty cheaply! The trouble with Zobowats is that they tend to surround you in a corner, so you can't get away after dropping a bomb. You have four lives, however, so it isn't as bad as it sounds. Some of the chambers are rather cramped, making it difficult to manoeuvre, and you start in a different room each time you play, so it is hard to work out a technique for dealing with each one.

Gremlin Graphics has produced some really excellent games for the C16 and Plus/4, and this is no exception. Complete with high score table, joystick or keyboard options, sound on or off, it is a thoroughly professional piece of programming. The graphics are colourful and varied, and the sound effects are just right.

The game is entertaining, and challenging enough to maintain interest. One word of advice — don't rush around too much, but be patient and you can achieve a very high score.

P.B.E.

### Thing on a Spring

★★★★  
Gremlin Graphics  
12/85  
C16 — joystick

IT'S A LONG TIME SINCE WE HAVE SEEN any C16 games from the stable of such classic games as Mandy Mole and Potty Pigson. However, Gremlin Graphics has now returned with vengeance with what is sure to be its latest chart topper — Thing on a Spring.

As ever your mission is to rid the World of some evil that has been unleashed upon it. This time, however, it's not the usual mad scientist or the Warsaw pact that you're out to stop, it's an evil golden who is trying to rid the world of all miceases.

This time you don't play the role of a tank commander or a superhero. Instead you find yourself quite simply as a Thing on a Spring.

Platform games have certainly become as common as Space Invaders, and it's quite a surprise that Gremlin Graphics has managed yet another one onto the market. Don't worry though, this isn't your run-of-the-mill platform game. It's far superior to most that have been launched recently.

Controlling Thing is no easy task, being a spring he tends to bounce around quite a lot. If you're not careful you'll find him bouncing right into the clutches of some evil monster who will reduce the amount of oil on his spring. Too little oil and games what happens!

Hidden around the numerous rooms in the Golden's lair are five switches. Thing needs to collect these before he can get around all of the complex. Finding the switches and finding out what they do turns what could have been a normal platform game into a real arcade adventure. It took me an hour to get out of the first room.

Thing on a Spring has some superb graphics and sound. Gremlin's claim that Thing is 'cute and awesome looking' isn't that far from the truth.

Rush out and buy it, you'll love it!  
S.C.

also a 'Time turn' which allows you to make last minute adjustments to the strength and direction of the shot as your golfer swings his club through the air.

You can then watch the ball fly across the screen and land on the fairway, or the rough, or the bunker, or the water hazards or even go out of bounds! The usual everyday frustrations of the handi-cap golfer prevail. At least you have the consolation that if you miss a two-foot putt no one else is watching.

The weekend hackers and club handi-

cap players alike will relish the chance of pitting their wits against an open championship course. Even those of you with no golfing experience should quickly learn enough of the rudiments of the game to play many enjoyable hours trying to fit a small white ball into a small white hole. This game is easy to learn but, like real golf, it's difficult to master. Holes in one, eagles, birdies and pars are all attainable but beware — bogey's abound in plentiful supply for the unwary.

P.T.

This month RuneCaster delves  
into the secrets of Exodus!  
Ultima III and encounters  
elves, dwarves bobbits and  
huzzles!

Oh boy...oh boy!

ARE YOU A FRUSTRATED BARBARIAN with your sword rusting on the wall? Perhaps, a mass bawling cleric resting between quests. Did you want to play Dungeoneer and Dragons...but couldn't find anybody else to join you at the right time or place - and, for the hours (days) necessary for a worthwhile quest?

Get down that sword, all the hiking boots, get in a groovy state of mind and prepare for an extended period away from the daily rat-race.

If you haven't got a C64 complete with disk drive, now is the time to invest...and, while you're at it, get a copy of Exodus: Ultima III by Origin Systems Inc., distributed in the UK by US Gold. This is such an interesting find that for the first time I shall be looking at only this one subject. I hope you like role playing games!

partially successful but have nearly all been for single adventures (no saving or have not really had that spark of "alternative reality" that makes for total player involvement.

### Presently Available

Other computers, especially in America, have had good role playing games written for them. Miserably for the Apple is one that immediately springs to mind. Now, at long last C64 users in the UK have their turn!

complete you have to switch off the computer (and disk drive) and reboot the operating system before you can play. The sole difference in "playing" and "creating" is whether you press the SPACE bar or 'C', once the main title appears. Don't make a mistake, or even loading the operating system takes several minutes!

This isn't a game to be played lightly. It takes time to set up and even more time to get over the initial learning period - what has to be said, which is the best way to make up your team of adventurers (you can control up to four in a game).

For this reason I could suggest a title

### In the Past

Some four years ago there was The Valley, where you could choose your character type (fighter, cleric, wizard etc.) and set off adventuring - battling a host of monsters, finding treasure and casting the odd spell. At the time it was quite a hit but with limited graphics and designed for the MSX, it now looks a little pale!

There have been several attempts to bring games like Bawling "role playing" games to the C64, notably perhaps the Dungeoneer series which included The Temple of Aphel. They have been

Ultima III could well prove to be a game which adventures will spend more thousands of hours playing. Sadly, it is disk based only, with no real hope of a cassette version ever appearing.

The operating system for the adventure comes on one side of the disk, with a program for creating a separate "scenario disk" on the other side. Before you can venture forth you must create this separate scenario disk.

This creation routine takes some time (about 12 minutes). When

cheating to start with once though you will be fleeing to get going. Make up two scenario disks! Make sure you format the disks with exactly the same "disk name" and ID.

We are now almost ready to start! Load the operating system...up some the main titles...press the SPACE bar...when, when...not long to wait now...insert your scenario disk when told to...we're there!

The initial screen displays a moving vignette of a team travelling around in hazy lighting monsters and generally

enjoying themselves. You could watch this for longer...but what about your own team?

Pressing **SPACE** gives you three options: Return to the moving vignette; separate a party; journey onward. You cannot choose the third without first creating your characters and forming a party so, your initial choice is determined for you.

Again a menu, giving the option to examine the main characteristics of existing characters, creating new characters, forming or disjoining a party, removing (renaming) characters and finally returning to the previous menu.

## Vital Statistics

Initially you must create a selection of characters - at least four. You can go adventuring with less than four but this is not recommended, especially to begin with!

You may have up to 20 characters 'in use' and in creating each one, you must define their order number (1-20), name, sex, race (human, elf, dwarf, halfling or goblin), birth-vital type has different potential abilities - dwarves are strong, elves are dexterous etc. You must bear this in mind - you wouldn't want a clumsy thief would you!

Next, you have to choose the character type - barbarian, thief, wizard, knight etc. There are 10 possibilities given and this choice must be made carefully.

Not only do you want a balanced party that can deal with whatever it means along the way but you must also allocate points (up to a total of 50) to your character's strengths, dexterity, intelligence and wisdom. This, together with size and type, will mostly characterise capabilities.

The permutations possible are quite enormous but after a few hours into the unknown you will start to get some idea of a viable party's requirements. You will probably 'zero in' on a couple of same sort - preferably one that can also use a little magic.

Then you'll need someone who can use prayers (priest, druid etc), if only because they can heal injured friends and also magically examine treasure chests the safe. Thieves seem to be very useful - personally I like the female, silver variety! Then perhaps the pure wizard type or even your original red-knobbed barbarian.

Finally the table that gives the characteristics for each profession, this will tell you what weapons, armour and spell type each may use and what compromise is made (if any) for the use of magic.

Make notes of each character's attributes as you go along there in. This is quite important, because once created but before setting forth, you cannot check such attributes points as strength, dexterity, intelligence and wisdom.

You may always call up a character's status during play but once the adventure proper has started you cannot return to the creation stage. When you have created sufficient characters then 'Form a Party', entering the four characters you have chosen, then return to the main menu and Journey Onward.

## Cheat!

If you want to 'cheat a little' press 'C', which allows you to save your position, remove the scenario disk and switch everything off! Now, reload the program operating system but this time put in the second scenario disk you created.

Go through the character creation and party formation routines, giving exactly the same information as you did the first time. The scenario disk records all your characters' changing data as the game progresses...including their death.

As this is quite likely to happen fairly soon to start with one of your cheat disks should be kept as 'clean' as possible. Use this one when you start each time and 'save your position' to the 'clean' one as your characters gradually improve their standing.

It is almost impossible to get away without somewhat corrupting these disks as you continue but at least it will eliminate a fair amount of time being spent creating characters when you would rather be learning how to play!

## At Large in Sossaria

You are there at last, with the wind in your hair, standing with open rolling plains behind you and a small walled city in front

of you. The display shows a plan view, with one character indicating the position of your party, water is shown to the right of the map and two buildings represent a castle and the small town. You can see some woods to the west.

To the right of the map is a 'vital sign' display of your four characters. This gives you at a glance such information as their level remaining, hit points (blooded), magic points (spell casting ability) and their level (all start at Level 1).

Further status information can be had

by typing 'Z' (status), this will tell you how much gold they have, what weapons or artefacts they are carrying and their present strength, dexterity etc.

## Naked into the World...

Each character starts with a dagger and cloth armour (1) but you must tell them to 'R' (ready the dagger for use and 'W' (wear the cloth armour... otherwise they will enter battle using their bare hands and in their skins!

There are also provided with 200 pieces of gold. The sensible thing to do next is 'Enter the town and visit either the weapons shop or the armoury. Weapons may be bought and sold at the listed price (not haggling) as also may be food when you need it, from the grocer.

## Just a Quick One...

There is also a path where useful (possibly) may be found (loot!). In some towns you may also find other useful places, but you always need to search for these very carefully. You can even talk to the various people you meet in the streets.

You are now third out in the front of your journey and leave the safety of the town. You have of course read the instructions that came with this gateway to another world but you won't have absorbed all they had to say, and will perhaps have noticed just some of the omissions - like, there is a lot of 12 spells...but only one is important!

The spells have intriguing names such as: **REFUND**, **METAR**, **PONTORI**, **SANCTU**, **LORUM** etc. Use of these depends upon the number of magic

points a character has, there is ten different upon character type and how you allocated those original 50 points. Only by playing, can you begin to understand how to achieve a workable balance.

## Spell That Again

By the spells at various times - while walking along in battle, but underground etc. So if you can work out what they do it don't know, I've only been playing for about 20 hours so far! **METAR** and

SANCTU are both very useful and may be cast only by level 1 characters.

When you rest or when being outside in the wild, it (or they) are naturally bloodthirsty (want!) and aggressive. It is occasionally possible to evade them but...

When combat occurs, the display shows a larger scale map, with the four members of your party towards the bottom and the evil ones towards the top. Once conflict has begun there is no retreat...and the losers are dead!

Battle at a distance is possible with a bow (unlimited arrows... great!), magic or even by throwing a dagger. Usually in the early stages, hand to hand combat takes place. Your team may swing their swords, maces, handaxes, only to the north, south, west or east. The enemy may also strike on the diagonal.

Each time a member of the team is hit their 'hit points' decrease. If they go to zero, they're dead. Once over the initial stages of 'finding out what to do', I found the combat and magic 'balance' one of the best I have come across.

Every time a member of your party kills one of the monsters, points are added to his or her 'experience points'. The greater the number of these, the higher the 'level' the character becomes and the more effective that person is at everything attempted.

## No Clock Watching

There is a 'real time' element throughout the game that is acceptable and although you must act fairly quickly, you do not have to be clary fast as in some games.

Having won your victory, the vanquished foe leaves behind the proverbial treasure chest. Someone has to open it to collect the spoils. Needless to say they are often heavily-trapped with a variety of unpleasant surprises.

If you have a clerical type amongst your party then all is solved by invoking **SPARKLING**. If this spell (properly) fails then it is worth trying again. No penalty type - then the next best thing is a thief, they can sometimes (1) spot a trap.

If it has been a costly battle then do not

be in a hurry to open the chest...a spot of 'healing' (also performed by your clerical type) may be worthwhile - the bodies have a habit of appearing at quite the most inopportune moments!

Monsters come in a variety of different guises, from misbegotten wizards, orcs, trolls, ghouls, zombies, giants, brachios to dragons, griffins, dragons, devils, balcons and even sea serpents to mention but a few!

## A Life on the Ocean

There are also pirates who can fire at you from their ships at sea. If you happen to be at sea (yes, your party can board and sail the occasional ship), there is even ship to ship combat. If you are at sea then watch the way the wind is blowing - you cannot sail into wind, you must tack!

## Let There be Light

It is possible to light your way magically but the spell lasts only a short time and can only be considered as a stop-gap measure. You have to find/buy (1) a lamp or torch.

There are also a few hidden 'Magic Gates'. Travelling through these will teleport your party to many parts of the old knowledge. These 'gates' are affected by the twin moons of Sauria - Tarnal and Felucia - and to help you in your understanding of the workings of these, the phases of the moons are included in the main display!

To stop playing, press 'Q', to save your Party's present status and simply remove the disk - but only after disk drive has stopped running of course - and switch everything off!

On your next visit to Sauria, you may either carry on where you left off, or disbanded the party and form another one. New characters may also be introduced at this time perhaps to be taken under the wing of more experienced adventurers!

This program is really the most complex and rewarding I've been fortunate enough to play for ages. It even includes the option for regular adventure web commands in special situations, such as 'KID RESCUE' or 'JUNK CLIMB' (in fact there is far more to this game than can possibly be covered here).

There is an underlying plot to *Ultima IV*, in addition to being a first class role playing adventure, it is concerned with events that took place in a previous adventure: *Sigge Perilous*. Any knowledge of this is completely unnecessary. It merely sets the scene for this vastly updated descendant.

The basic story-line is the rising power of evil and the call to Lord British to would-be adventurers, to rid the land of unprovoked unprovoked evil entity. There are some clues that may or may not help one of which is the word *Exodus* scrawled in blood, found on a derelict merchant ship.

Perhaps I might get round to the deeper meanings of *Ultima IV* in a month or so, but for now my main word has been cleaned and hooked to perfection, my boots have new nails and I've just had my last cigarette. Be seeing you...in Sauria.

## Foot Note

Unfortunately, US gold, the UK distributor, has only included in the package the game disk, the book of play and the reference card - omitting the map and additional booklets describing the spells available to the cleric and mage. Since these will be vital to your success in the game, Computer Games will be publishing the vital mission material in its September issue.

Barry Miles has been looking at Handic's box of tricks and he found one or two surprises.

THIS PRODUCT IS A VERY INTERESTING combination for the C64 user. It is both a motherboard to enable up to three cartridges to be installed simultaneously and also an IEEE interface.

If you own an earlier Commodore machine you may already own a disk drive. The early models used the IEEE 488 parallel bus, normally known as the "1-triple-I" bus. This was a slight variation on the original design by Hewlett Packard.

When the Vic 20 arrived, Commodore, to many peoples' amusement, changed to a Serial system. This resulted in data being passed along the line with the bits following one another rather than eight bits going in parallel. Obviously, this slowed down the data transfer rate and the 1541 disk drive used on the Vic 20 and the 64 has been slated for its slow performance ever since. This same problem has been adopted on the C16 and the Plus/4.

The faithful Commodore user must buy some form of interface to make the 4080, 8050, 8250, 1081, and 2031 drives work with the 64. Oxford Computer Systems Interspec - happily still available - solves this problem but enables those disks to communicate with the 64 at only the same speed as the 1541.

What the average user wants is to be able to take advantage of the maximum speed of which the disk drive is capable.

Generally speaking the interfaces which are available rely on placing some machine code in the memory of the 64. This sometimes conflicts with memory demands made by advanced packages.

There are difficulties when it comes to connecting a number of cartridges to the 64 and switching between them. Many and more ingenious manufacturers are putting perfection into their cartridges which creates problems.

Handic's approach was to supply an IEEE interface board enabling the user to choose between three cartridges plugged in at once, while at the same time being able to use Commodore disk drives at full speed. In addition, the product has a Reset button.

This was an interesting aspect of the design because it combined three desirable features. It is frustrating to plug in another board in order to use your cartridges only to find that you cannot use your disk drive.

The Superbox 64 is a Swedish product and seems very durable. The rigid metal case looks as if you could drive a car over it without damage.

# SUPER BOX 64

The only protrusions are the edge connectors. One for your IEEE cable and the other for plugging into the cartridge slot on the machine. There are rubber feet on the bottom to make sure that the box will lie flat. No 8086 in the 64 is used and this avoids any memory conflict.

In order to pick up the necessary signals it is necessary for you to connect a movable clip to a single resistor on the C64 board. This is not a difficult task to do but nerves and have-lived wires may prefer to get their dealer to do this for them. Fortunately you can remove the box, should you need to do so, while retaining the connection.

The switching has been very pleasantly designed indeed. As the far end of the box, is a set of five switches. As you switch on one cartridge slot the other switches pop-up, the only way you can accidentally have two cartridges in the product at once is by pushing two buttons simultaneously.

The IEEE button will connect you to your parallel IEEE device. The Reset button is a great advantage because the 64 unlike its successors, the C16 and the Plus/4, had no reset button whatsoever. By pressing this red reset switch a "Cold start" is performed which leaves the contents in RAM unaffected. If the system has "hung" use of this button may get you out of trouble without losing any data.

## In Use

Testing the box with a variety of cartridges showed that most of them would work perfectly OK. Certain types of cartridge however would not function correctly.

There is a somewhat startling warning in the brief A4 sheet manual saying that if an IEEE unit is connected to the board and not switched on when the machine is

running, the Superbox 64 may be damaged. Inquiries of Handic UK, confirmed that this was merely an example of Swedish caution and not to be taken too seriously.

You are warned not to connect more than two IEEE units at the same time and to make sure that all units connected are switched on before running the system. I was not tempted to test this out with a variety of extra IEEE units!

## Conclusion

At £65, the Superbox 64 is not a cheap product in fact if you compare it directly with another mother-board you will find it extremely highly priced. However you are really getting two products for the price of one! Highly recommended.

The only difficulty likely to be experienced in using the Superbox arises because of its all-on-nothing approach to life, you are expected to be using either all Serial or all Parallel IEEE devices. An addendum to the manual gives a partial fix for this.

By PRESSING five memory locations and recording their content manually, you enable the use of the Reset button without the loss of a Basic program. Thus, you press the button to switch between IEEE Serial and Parallel in either direction and then press the Reset button. Finally, you FORCE the data which you have recorded into the same memory locations.

## THE FINAL CARTRIDGE

- A new outside OPERATING SYSTEM built in a cartridge, that does not use any memory and is always there compatible with 99.9% of the 20000 C64 programs.
- 24K EXTRA RAM for basic programs.
- A DISK TURBO that not only LOADS 4 TIMES FASTER but also SAVES 4 TIMES FASTER!
- A PRINTER INTERFACE that is compatible with all the well known electronic printers and Commodore printer programs. Prints out all the Commodore graphic characters and control codes.
- A SCREEN DUMP for normal and hires screens (e.g. Doodle). With a special built in routine that searches for the memory address of the hires picture automatically.

FOR C64-64

£ 50,-

- PREPROGRAMMED FUNCTION KEYS: Run, list, load, save, catalog etc.
- MACHINE LANGUAGE MONITOR: very sophisticated assembler/disassembler/memo for
- BASIC 4.0 and DOS COMMANDS: Load, Save, Catalog, reads directory without disturbing your programs.
- BASIC TOOLKIT: auto

number (incl. gated) help etc. RESET SWITCH: Resets to monitor. Resets with old floppy your basic program intact! Resets every protected program

• CASSETTE TURBO that loads and saves programs 10 TIMES FASTER including files and records.

explain the use of code other than decimal and hexadecimal.

1000 1000

Understanding of the mechanics behind RCDs. Each module should be thought of as a separate black box, the right-hand box represents the units column and the left-hand box represents the tens column. Here are some RCD examples:

[illegible][illegible]

Apart from the difference in interpretation, the BCD code has, after the code bodies are placed to call redundancies. We can see what this means when we consider the number of possible ways in which binary bits can be arranged. For simplicity, let's start with two bits. These can only be arranged in four ways: 00,01,10 and 11. Three bits can be arranged in 8 ways: 000,001,010,011,100,101,110 and 111. For four bits, there are four ways (2<sup>4</sup>) and for three bits there are eight ways (2<sup>3</sup>) so we can deduce from this that the general formula for knowing the number of ways of arranging *N* bits is 2<sup>*N*</sup>. Now, in the case of an eight bit byte, we can expect that there are 2<sup>8</sup> = 256 ways of arranging the bits. Normal binary and hexadecimal codes use all these combinations, but BCD doesn't. In fact, as the following table shows, there are six illegal combinations (redundancies) in each nibble:

```

10 030E      ! CONVERT ASCII TO BCD DIGIT
20 0300      **BCD00
30 0000      MEM          = 4PB
40 0000 30      SEC
50 0001 05FB      LDA MEM
60 0003 0730      SEC **C30
70 0005 05FB      STA MEM
80 0007 00      BTR

```

```

10 033C      ! CONVERT BCD DIGIT TO ASCII
20 0000      **=BCD00
30 0000      MEM      = #FB
40 0000 10      CLC
50 0001 00FB    LDA MEM
60 0003 0730    ADC #30
70 0005 00FB    STA MEM
80 0007 60      BTR

```

B.C.D	Decimal	
0000	0	0000
0001	1	0001
0010	2	0100
0011	3	0101
0100	4	0110
0101	5	0111
0110	6	
0111	7	
1000	8	
1001	9	

As you can see, the illegal combinations are those greater than 1001. These are the combinations normally represented by the letters A to F in hexadecimal.

We conclude therefore that representing numbers in BCD is inefficient because, out of 16 possible combinations, only 10 are used. In percentage terms, this represents an efficiency of only  $(10/16) \times 100 = 62.5\%$ . As far as memory usage is concerned, we need about 38% extra memory space to store numbers of BCD form because a full nibble is still required for each BCD digit in spite of the combinations which remain unused. We can represent efficiency in a more obvious way by comparing BCD with unsigned binary in respect of the largest number capability. The largest legal combination in BCD is 1001 1001, 99 in decimal, whereas in unsigned binary the largest is 255 decimal.

## BCD addition

Since we haven't yet seen combinations greater than 1001, what exactly happens when we add 1 to the BCD 1001 under normal binary conditions, the addition would be quite straightforward:

```

0000 1000
+0000 0001
-----
0000 1001

```

But, the right-hand nibble now has an illegal combination! However, if the 0001 had been previously instructed (by means of BCDs) to perform the addition in BCD, it would perform as follows:

```

0000 1000
+0000 0001
-----
0001 0000

```

Note that adding the 1 has resulted in a permanent carry from the right-hand nibble into the left-hand nibble. It is called the 'half carry' to distinguish it from the normal carry out from the add-end. Note carefully that the total (98 in decimal) is correct in BCD format. How does the microprocessor perform this bit of trickery? Actually, the answer is simple. It performs the addition in normal binary and then tests the result. If the right-hand nibble is illegal it then adds a further six. This may seem mysterious but is quite logical when you think about it because there are six illegal combinations which must be skipped. Examine the following example, using the previous figures:

```

0000 1001
+0000 0001
-----
0000 1010      illegal, so
+0000 0110
-----
0001 0000      result correct in BCD

```

## Program 12.1 Convert hex digit to ASCII

```

10 033C      ! CONVERT HEX DIGIT TO ASCII
20 C000      ##=BC000
30 C000      MEM          = #FB
40 C000 10      CLC
50 C001 00FB      LDA MEM
60 C003 C90A      CMP #10
70 C005 F002      BCC OVER
80 C007 0706      ADC #6
90 C009 0730      OVER    ADC ##30
100 C00B 05FB      STA MEM
110 C00D 60      RTS

```

## Program 12.4 Convert ASCII to hex digit

```

10 033C      ! CONVERT ASCII TO HEX DIGIT
20 C000      ##=BC000
30 C000      MEM          = #FB
40 C000 30      SEC
50 C001 05FB      LDA MEM
60 C003 0730      SEC ##30
70 C005 C90A      CMP #10
80 C007 9002      BCC SKIP
90 C009 0707      SEC #7
100 C00B 05FB      STA MEM
110 C00D 60      RTS

```

You should try out this trick with various combinations to convince yourself that it works every time.

## What use is BCD?

Since BCD has been demonstrated to be inefficient, the obvious question is what do we get in return? One answer, not the most important, is simplicity. Only a cursory glance at the contents of a BCD byte is sufficient for most of us to convert into the equivalent decimal. However, a more substantial reason for including BCD in a computer is to make it compatible with external equipment, particularly the vast army of digitally controlled instruments. Most instruments of this form are equipped to either accept BCD formatted inputs or deliver BCD outputs. For example, a digital voltmeter can transmit readings from an external system to the computer in BCD 'language'. Conversely, a variable voltage power supply can be controlled by

sending BCD information from the computer.

It is realised, of course, that the majority of readers may not have access to such equipment in which case these facilities may be of little interest. But, we should remember that any computer has vast potential. It is possible that addition to games, entertaining though they may be for a time, may not last for ever and many users may feel the urge to exploit their machines in other directions. We should bear in mind that the input/output bus in Commodore machines, ever since the days of the original PET 2001, have been based on an industry accepted standard known as the IEEE bus protocol. Thus, the Commodore employs a slightly modified version of the bus but, in general, it is reasonably compatible. We have no space in this article to discuss the details of the bus although we should point out that BCD is the accepted code used for passing numerical data between computer and external equipment.

BCD is also useful as a convenient

Program 11.1. Add two BCD Numbers and display result.

```

10 033C      !ADD TWO BCD NUMBERS AND DISPLAY
20 033C      !THE RESULT IN DEC DIGITS
30 033C      NUMBER1      = #FB
40 033C      NUMBER2      = #FC
50 033C      RESULT       = #FD
60 033C      CHROUT       = #FFD2
70 0000      **BCD000
80 0000 FB      DEC
90 0001 A90B      LDA #B

110 0005 A90F      LDA #F
120 0007 80FC      STA NUMBER2
130 0009 1B      CLC
140 000A A5FB      LDA NUMBER1
150 000C A5FC      ADC NUMBER2
160 000E 80FD      STA RESULT
170 0010 201BC0    JSR OUTPUT
180 0013 00      CLB
190 0014 60      RTS
200 0015
210 0016 4B      !
220 001A 4A      OUTPUT      FMA
230 0017 4A      LSR A
240 0018 4A      LSR A
250 0019 4A      LSR A
260 001A 1B      CLC
270 001B A930      LDA #30
280 001D 20D2FF    JSR CHROUT
290 0020 6B      PLA
300 0021 290F      AND #0F
310 0023 A930      LDA #30
320 0025 20D2FF    JSR CHROUT
330 0028 60      RTS

```

intermediate code useful as a stepping stone for other conversions.

### Code conversions

The above discussion on BCD raises the general question of conversion between codes. It is often required to convert information from one code to another, either for reasons of efficiency or convenience. The conversion can be achieved by short program segments, preferably written in machine code. For the most part, they are short so instead of the usual practice of presenting an additional hex dump, we shall present them in full assembly form which includes the equivalent op-codes in hex.

### Convert BCD digit to ASCII (See Program 12.1)

Program 12.1 Convert BCD digit to ASCII

For the benefit of those who do not have an assembler, the columns, reading from left to right, have the following significance:

Column 1 is a line number, used for reference purposes only. (You can't jump to a line number like we do in BASIC).

Column 2 is the hex address of the location which stores the first byte of the current instruction.

Column 3 is the instruction in terms of machine code hex digits.

Depending on the instruction, there may be one, two or three pairs of hex digits. The first pair will always be the op-code and the remaining pairs, if any, will be a single or double byte operand.

Column 4 is the label field. That is, it will contain arbitrarily chosen labels for branch destinations. If no labels are used, the column is left blank.

Column 5 is the instruction in assembly language, consisting of the mnemonic

code and operand.

Those without an assembler will have to place Column 3 machine code bytes in the data statements of the hex loading program given in part 3 of this series (December issue). Taking program 12.1 as an example, the data statements would be entered as follows:

DATA 18,45,18,4B,30,65,FB,60

### Description of program 12.1

Line 10 starts with ! and is simply a comment. Line 20 tells the assembler to locate the program starting at the address 8000. (In our assembler, 3 means hex, not string).

Line 30 tells the assembler that the address FB is to be known by the symbolic name NUMBER1. It is assumed that the current contents of MEM is holding the BCD-digit to be converted.

Line 40 clears the carry ready for the later addition.

Line 50 loads the accumulator with the BCD digit.

Line 60 uses immediate addressing to add hex 30 (decimal 48) to the BCD digit. Suppose MEM originally held 3. When 48 is added, it would hold 51 which is the ASCII code for 3.

Line 70 stores the converted number back in the original location. The program can be used as a subroutine called from within a BASIC program by using SYS 49152.

This simple program has been treated in extra detail because the full assembly format may be new to some readers. It is hoped that the programs which follow can be understood without resorting to a similar line by line analysis.

### Converting ASCII to BCD digit (See Program 12.2)

Program 12.2 Converting ASCII to BCD digit

This is actually the mirror image of the previous program, the only difference is that 30 is subtracted instead of being added. However, we should note that the carry has to be set, using SEC, before a new subtraction instead of being cleared by CLC.

### Convert hex digit to ASCII (See Program 12.3)

Program 12.3 Convert hex digit to ASCII

Line 60 compares the value of the hex digit with 10 decimal. If the carry is set in line 70, it signifies that it is less than 10 so a branch is made to line 80 where it adds hex 30 to fit it into the ASCII band.

If however, the previous comparison

showed that the hex digit was 16 or greater, an extra six is added to allow for the gap of seven between the ASCII code for 9 and the ASCII code for A. Note that the carry is always set before the ADC #6 instruction so, in effect, we are adding 7.

### Converting ASCII to hex digit (See Program 12.4)

**Program 12.4** Convert ASCII to the hex digit.

This program is almost a mirror image of the previous one, except of course that subtraction of hex 30 is involved instead of addition which is why line 40 sets the carry. Notice that, this time, the full 7 is subtracted (the gap between ASCII '9' and ASCII 'A') since the BCC instruction is entered with the carry set.

### Addition of BCD numbers (See Program 12.5)

**Program 12.5** Add two BCD numbers and display result.

The program is intended only as a guide to the general procedure of adding in BCD. Because of this, the implementation used 9 have been used for the two numbers. The result, 17, is arranged to be printed out on the screen using the ROM subroutine CHROUT. (We must remember that CHROUT will only print the character corresponding to the ASCII code in the accumulator.) Practical versions will, of course, be more likely to supply the numbers as variables.

### How the program works

Lines 36 to 40 assign the variable addresses NUMB001, NUMB002 and RESULT together with the ROM character output subroutine at address 1F02 hex. (Line 38, by use of the instruction SED, makes use of the 6807's ability to perform all following arithmetic in BCD.)

Lines 50 and 120 store the arbitrary constants for later use.

Lines 130 to 140 performs the addition of BCD; the add-6 operation is carried out automatically by SED.

Lines 170 and 180 store the result and then call on OUTPUT. The machine is then reset for normal binary arithmetic by use of CLD. The subroutine OUTPUT is used to prepare the accumulator for action by CHROUT.

A copy of the raw data is first placed on the stack by use of PHA. The accumulator at this point will contain:

```
0002 0011 (17 BCD)
```

The accumulator is then shifted right 4

**Program 12.4** Displaying contents of location in hex.

20 033C	!DISPLAYING THE CONTENTS OF A	
30 033C	!LOCATION IN HEX DIGITS	
40 033C	NUMBER	= #FB
50 033C	CHROUT	= #FFD2
60 0300	#=4C000	
70 0300	!	
80 0300 A0FB	LDA NUMBER	
90 0302 2004C0	JBR OUTPUT	
100 0305 40	RTS	
110 0304	!	
120 0304 40	OUTPUT	
130 0307 4A	PHA	
140 0308 4A	LSR A	
150 0309 4A	LSR A	
160 030A 4A	LSR A	
170 030B C70A	CHP #10	
180 030D 7002	BCC OVER	
190 030F 6704	ADC #6	
200 0311 6730	ADC #430	
210 0313 2002FF	JBR CHROUT	
220 0314 40	PLA	
230 0317 240F	AND #0F	
240 0319 C70A	CHP #10	
250 031B 7002	BCC OVER2	
260 031D 6704	ADC #6	
270 031F 6730	ADC #430	
280 0321 2002FF	JBR CHROUT	
290 0324 40	RTS	

places in order to position the higher order digit at the right:

```
0000 0001
```

The addition of 30 hex is then added to fit the number into the ASCII table; the accumulator will now contain:

```
0011 0001 (31 hex, 49 decimal)
```

This is the ASCII for the digit '7' so when the subroutine CHROUT is called, this will appear as the first digit result on the screen. The original raw data is pulled back from the stack using PLA so the accumulator now holds, as before:

```
0001 0111 (17 BCD)
```

We now AND with:

```
0000 1111 (0F hex)
```

which produces:

```
0000 0111
```

As you can see, the accumulator now holds only the least significant digit (7) of

the original BCD result. The usual 30 hex is then added to convert to ASCII so the accumulator now holds 37 hex (55 decimal) which is the ASCII code for 7. The accumulator is then sent to the screen via another call to CHROUT for displaying the second digit of the result.

### Displaying contents of location in hex (See Program 12.6)

**Program 12.6** Displaying contents of location in hex.

This program does not justify detailed explanation since it is broadly similar to the previous one. This time, SED is not used, we expect that somewhere along the line, we have to add six, just like 120.

### Summary

This article has attempted to show some of the various techniques which can be used for code conversion. Consequently, the programs should be integrated only as guide lines to be introduced in practical subroutines.

## FAST LOADERS TO DISK

## COMMODORE 64 1541 DISK DRIVE

## TAPE FAST LOADERS

### MEGA-TRANSFER DISK — £16.00

A highly collection of routines which will efficiently transfer an extremely wide range of fast loading tapes to disk. General purpose routines to transfer tapes, Pex, Turner, Mass, Vector, C24 loaders and more. A huge menu of individual routines for specific loaders, including Commodore standard loaders, the latest sports simulations and top arcade and adventure games. Over 100 routines for those difficult to load tapes which won't load Disk II I can't handle. And a whole routine for programs recorded using R & S, Fastload and Hyperload. Includes a program identifier. All transfer automatic. No user knowledge required. MEGA-TRANSFER DISK is the fastest transfer utility available for fast loading programs. Don't settle for less.

### MEGA-UTILITY DISK — £11.00

1. ALPHA-LOAD Disk Turbo Loader. Add this short program to MEGA of your disks and your programs will load at over 1000 times the normal rate. NO menu to respond (it's) into DON'T have to load programs accurately. Fastload (10) blocks. Normal speed 100 seconds - with ALPHA-LOAD (10) seconds.
2. FAST COPY. A high class single drive whole disk speed. Backup a full disk in a disk over 2 minutes. No handle many commercial disks but not if heavily protected.
3. A multi option FAST disk formatter and a single file transfer routine which will handle program files of any length.
4. FROM TO TAPE. Transfer any single disk program to tape (fast load). No manually coded, will handle programs of 300 blocks and more.

### DISK II — £11.00

The Premier tape to disk transfer utility for your disk load tape collection. Multiple transfer modes and subroutines are all covered for NO user knowledge required. Disk II has provision for program tape which no other utility can handle. Supported on disk.

DISK II is a collection of routines which will efficiently transfer an extremely wide range of fast loading tapes to disk. General purpose routines to transfer tapes, Pex, Turner, Mass, Vector, C24 loaders and more. A huge menu of individual routines for specific loaders, including Commodore standard loaders, the latest sports simulations and top arcade and adventure games. Over 100 routines for those difficult to load tapes which won't load Disk II I can't handle. And a whole routine for programs recorded using R & S, Fastload and Hyperload. Includes a program identifier. All transfer automatic. No user knowledge required. MEGA-TRANSFER DISK is the fastest transfer utility available for fast loading programs. Don't settle for less.

### 11 TAPE SPECIAL 11

FAST Diskload transfer is a highly efficient tape to disk transfer utility. It will transfer any tape to disk at over 1000 times the normal rate. NO menu to respond (it's) into DON'T have to load programs accurately. Fastload (10) blocks. Normal speed 100 seconds - with FAST (10) seconds.

FAST Diskload transfer is a highly efficient tape to disk transfer utility. It will transfer any tape to disk at over 1000 times the normal rate. NO menu to respond (it's) into DON'T have to load programs accurately. Fastload (10) blocks. Normal speed 100 seconds - with FAST (10) seconds.

All programs for the Commodore 64. Send SAE for full details or cheque/PO. No tax despatch to:

## Key operations

As supplied the AxiWin will function with virtually all printers. To get the best out of your system, you set up the three dip switches to match the printer type which you are using. Based on Epson F800. The Universal setting will enable you to use a Doherty&Soni printer, although of course the members resolution is then lost.

Switch 5 controls the ASCII character conversion. Switch 6 selects the device number. If you change the switch settings after power-up you must press the Reset button.

**Comments:** 1994 regulation

When `linewidth` number 5 is in the all positions, you obtain an exact simulation of the 152's performance. If you specify appropriate control codes you will be able to do double-width printing, or have a columnar table up to 80 print positions available by sending `21000100` followed by 2 numbers which specify the start column. You can also set up your own user-definable character and can assign code calculation, making your point head to any one of 400 dot positions. There is a `Graphic Repeat` function which repeats a single character.

In the Circular mode, you are also able to use additional commands which are peculiar to the HP41C. By opening a file on your printer with a secondary address

of it, you arrange that all the commands which normally result in a reverse field character appearing when a BASIC program is listed, are now translated into readable mnemonics. This makes your listings transparently obvious, even if you have not memorized the Commodore-synchro.

In this mode you are not able to print Commodore graphics as graphics. What is printed instead is the key which would be struck on the keyboard in order to produce that graphic symbol. This is particularly helpful for printing our programs which use vertical or horizontal bar graphics symbols, which are very difficult to distinguish from one another.

You can also set the left and right-hand printer margins to leave plenty of space for notes or to perforate the sheets for filing purposes.

### Sending control codes

The Translucent mode of operation enables you to send codes to your printer which control various special features. You merely open the file to the printer with a secondary address of five. Once this is done all print commands are sent literally. Problems could arise if you wanted to send commands to the printer while you were already in Emulation mode. The Commodore 128 itself takes to certain escape sequences. However this has been retained for the assurance that the

control sequence will be correctly transmitted to your printer if you precede it by an extra ESC-AP character.

The APP-600 has a number of extra features to make life easy. You will find it useful to keep the interface clean and tidy, because the switches and buttons are likely to be in continuous use. The push buttons initialize the interface. If you are using single sheet mode, the printer prints at the bottom of each page. You simply press the button once to continue printing. There is a monitor which is used to check whether the interface is working satisfactorily. You can delete the right margin of 80 columns if your printer has a wide station and you need to use that

There is a "skip-over perforations" feature, which is disabled on power-up. This is combined with a form length setting command which enables you to accommodate different sized sheets of paper.

## Conclusion

This interface has a wide range of capabilities, is very easy to use and fills a substantial need. While quite expensive, its versatility, in offering Comshare users a wider selection of printers, justifies the price. And, the Inmate mode prevents the frustration of not being able to use Comshare printer-oriented software. The MPW/80 is well designed, robust and is highly recommended.

mess? Get them  
sorted out with this  
program by Les Allen.

# D·I·S·K ORDERLY

WHEN SAVING FILES TO DISK, it is nice to retain an orderly sequence so as to keep a group of files together. However, when a file is switched from one disk a 'gap' is left in the directory such that the next SAVE is made to that location. This means that if a number of associated files are being made the sequence is jumbled.

Utilities exist on the market such as a disk director that enables a tidy routine to be applied to the directory but again the sequence can be lost as the routine used is an alphabetic sort and not a manual sort.

With this utility the order can be decided upon by the user simply by swapping any two locations at a time until the desired sequence is obtained. Of course it may take several operations to get the directory sequence but it works and works well.

The utility works by reading the directory contents into several arrays to store the name, track and sector, file type and file data which is then displayed on the screen for editing. Due to the limitation of the system the maximum number of entries allowed is 48. Simply select the two locations to be swapped, repeating the process for as long as necessary, and select \* or N to enter the new directory.

## Functional Listing

- 14 - 16 clear screen and set up colours
- 18 - 24 variables for screen title
- 26 - 30 print screen and look for RETURN key pressed
- 40 set initial variables for track/sector/buffer pointer
- 48 initialise drive
- 50 opens a random file
- 52 - 76 get name from track 16/sector 6 and print to screen
- 78 - 82 dimension arrays
- 90 - 108 read each directory entry and check for an open file
- 110 - 128 print each name to the screen
- 142 - 158 manual sort routine
- 164 - 168 write new directory to disk
- 168 - 174 disk error channel test
- 176 - 182 number of characters to be read from buffer
- 190 - 232 read character from buffer
- 300 - 308 get OK to continue

# WIZARD COMPUTER GAMES

A NEW EXCITING ADVENTURE GAME By Tony Crowther

£1000 Treasure to be won & a free disk with every game

Available for Commodore 64, Spectrum & MS-DOS (from October 1991) (also available for Amstrad)

## WILLIAM WOBBLER

William Wobbler is the latest game from Tony Crowther—a most exciting adventure game. Through the underworld of dark powers in search of golden treasure William struggles against all odds to vanquish foes and reach his goal. A game of skill and excitement.

# Choosing the right computer is a good start — but can you find the right software?

At SUPERSOFT we're very conscious of the fact that people who spend several hundred pounds on computer equipment are looking to do rather more than play Space Invaders.

Financial planning is a rather grand name for something you've been doing all your life — making ends meet! Perhaps if Mr. Microbeaver had used **BUSICALC** he would have been able to balance the books a little better.

For home, club or small business use **BUSICALC 1** should pay for itself in no time at all; for larger companies we recommend **BUSICALC 2**, one of the few really valuable programs that you can learn to use in a day.

Although your Commodore 64 is a powerful musical instrument you need to be a pretty good programmer to understand how it works. Unless, of course, you buy **MUSIC MASTER**.

To use **MUSIC MASTER** requires no prior musical knowledge, though in the hands of an experienced musician it will prove an invaluable tool. You don't need to know the first thing about programming either! **MUSIC MASTER** is the musical equivalent of a word processor, remembering the notes you play and allowing you to replay and edit them as you wish.

**INTERDUTOR PILOT** is a space flight simulator. Nowadays simulators are widely used to train pilots and astronauts because — to be frank — it's a lot cheaper (and safer) than the real thing!

Imagine, if you will, life in the 23rd century; space travel is commonplace, and on the outskirts of the galaxy the first war between civilisations is being fought. A shortage of trained pilots has prompted the Federation to develop a computer simulation that allows new recruits to gain experience without paying for their mistakes with their lives. With the aid of your Commodore 64 you too can learn to pilot the Interdutor Mk 3 craft. But be warned — this is no game!

Other SUPERSOFT products include the **MICRO ASSEMBLER** cartridge, the only assembler that's ideal for beginners yet powerful enough for the professional (most of our competitors use 8085); the **VICTREE** cartridge, with dozens of commands to BASIC including logical and disk commands; or on disk there's **MASTER 64**, a really comprehensive package for the latest programmer.

Of course, we do also publish games programs, and with classics like **STOL**, **QUIPO** and **KAMI-KAZI** in our range we are one of the market leaders. But we most enjoy coming up with the sort of programs that are going to be in use for months and years, not hours and days — the sort of programs that make you glad that you bought a computer — and glad that you bought SUPERSOFT!

You won't find SUPERSOFT products on the shelves of your local supermarket. But most specialist shops stock titles from our extensive range (and are prepared to obtain other programs to order). However you can also buy direct by sending a cheque/pre-paid order, or post (even), by calling at our offices, or over the telephone using your ACCESS card.

SUPERSOFT, Winchester House, Canning Road,
